METHOD AND APPARATUS FOR COMPUTED RELEVANCE MESSAGING

BACKGROUND OF THE INVENTION

5

10

25

TECHNICAL FIELD

The invention relates to a new process of communication using computers and associated communications infrastructure. More particularly, the invention relates to a method and apparatus for computed relevance messaging.

DESCRIPTION OF THE PRIOR ART

The aim of a communications process is to relay information between pairs of actors who, for purposes of the discussion herein, consist of an information provider and an information consumer. The following briefly discusses the concerns of each party.

20 Concerns of information provider

The information provider knows of pieces of information and of corresponding situations in which certain consumers would find those pieces of information interesting, useful, or valuable. For example, such pieces of information may concern problems consumers who have particular attributes might be interested in solving or that concern opportunities of interest to consumers

10

15

20

having such particular attributes. The provider wishes to distribute the information to those consumers in those specific situations.

In principle, an information provider might know of thousands or millions of conditions about which it can offer information. The audience for such conditions might involve thousands or millions of consumers.

A particularly interesting situation is where a typical piece of information should be directed only to consumers having a very special combination of circumstances. A typical piece of information would in principle be of interest to only a small fraction of the consumer base, but where this small fraction nevertheless amounts to large number of consumers.

A challenging but very important case occurs when verifying when the conditions for applicability of a certain piece of information requires knowing a great deal of detailed information about the consumer, his concerns and affiliations, or his property. This information might be considered very sensitive by consumers, who would not want to participate in a process that required disclosure of the information to the provider. Therefore, it might seem impossible to target the information to consumers because only the consumers have access to the information required to make the determination that the information applies to them, and they are unwilling to expend the effort to make a determination themselves, or to give others access to the sensitive information required to make the determination on their behalf.

25

Concerns of information consumer

The consumer is an individual or organization that knows of information providers who have information of potential benefit to them. The consumer may in fact know of tens or hundreds of such providers. Typically, at any given moment, only a small fraction of the information being offered by the information provider is of potential interest to the consumer. The consumer does not want to review all the information available from the information provider. He would prefer to see the subset consisting of information, which is relevant to the consumer.

10

15

20

25

5

Typically, the information which the provider is offering changes with time and the conditions experienced by the consumer are changing with time. The consumer would prefer not to have to track changes continually in his own status and the status of the information provider's offerings. He would also prefer not to have to remember that pieces of information published some time before could have suddenly become applicable.

The consumer would prefer that a procedure be available for automatically detecting the existence of applicable information as it became applicable, either because the consumer's situation had changed, because the information provider's offerings had changed, or because the conditions for applicability of the information involved time considerations which had become applicable. The consumer would prefer not to reveal to the provider information about his identity or the details of his interests, preferences, and possessions. Rather, the consumer would prefer to receive information in a form where he may carefully study it before using it.

10

The consumer would also prefer to have a method to inform himself about known problems with an information provider or with a certain piece of information before using the information. Typically, the consumer would prefer that if the decision to use a piece of information is made, the application of the information is painless and essentially automatic. The consumer would prefer to be insulated from the prospect of damage caused by incorrect information.

It would therefore be advantageous to provide a communications technique that addressed each of the above concerns with regard to both the information provider and the information consumer.

SUMMARY OF THE INVENTION

The invention disclosed herein enables a collection of computers and associated communications infrastructure to offer a new communications process. This process allows information providers to broadcast information to a population of information consumers. The information may be targeted to those consumers who have a precisely formulated need for the information.

This targeting may be based on information which is inaccessible to other communications protocols, for example because under other protocols the targeting requires each potential recipient to reveal sensitive information, or because under other protocols the targeting requires each potential recipient to reveal information obtainable only after extensive calculations using data available only upon intimate knowledge of the consumer computer, its contents, and local environment.

The targeting also includes a time element. Information can be brought to the attention of the consumer precisely when it has become applicable, which may occur immediately upon receipt of the message, but may also occur long after the message arrives. Again, this is a feature inaccessible under other communication protocols, where the time of distribution of information and the time of consumer notification are closely linked.

The communications process may operate without intruding on consumers who do not exhibit the precisely-specified need for the information, and it may operate without compromising the security or privacy of the consumers who participate. For example, in one implementation, the information provider does not learn the identity or attributes of the individuals who receive this information.

15

20

10

5

This process enables efficient solutions to a variety of problems in modern life, including the automated technical support of modern computers. In the technical support application, the disclosed invention allows a provider to reach precisely those specific computers in a large consumer population which exhibit a specific combination of hardware, software, system settings, data, and local environment, and to offer the users of those computers appropriate remedies to correct problems known to affect computers in such situations.

The presently preferred embodiment of the invention is specially tuned to address the concerns of consumers and providers in a technical support

application. Many other interesting applications areas and embodiments of the invention are also described herein.

This particular embodiment of the invention is described as follows:

5

Actors, referred to herein as advice providers, author advisories, which are specially structured digital documents which may contain:

(1) Humanly-interpretable content, such as text and multimedia;

10

20

- (2) Computer-interpretable content, such as executable programs and data; and
- (3) Expressions in a special computer language called the relevance language.

The relevance language describes precise conditions under which a given advisory may be relevant to a consumer, by referring to properties of the environment of the consumer computer interpreting the message, such as system configuration, file system contents, attached peripherals, or remotely accessible data. The humanly-interpretable content in an advisory may describe the condition that triggered the relevance determination and propose an action in response to the condition, which could range from installing software to changing system settings to purchasing information or software.

The computer-interpretable content may include software which performs a certain computation or effects a certain change in the system environment.

Advisories are communicated by a process of publication/subscription over a wide-area network such as the Internet. Advisories are placed by their authors at well-known locations, referred to herein as advice sites. Applications referred to as advice readers running on the computers of advice consumers periodically obtain advisories from advice servers which operate at advice sites.

Advice readers process the messages so obtained and automatically interpret the relevance clauses. They determine whether a given message is relevant in the environment defined by the consumer's computer and associated devices. The user is then notified of those messages which are relevant, and the user may read the relevant advisories and invoke the recommended actions.

15

20

10

5

Relevance evaluation is conducted by parsing relevance language clauses into constituent method dispatches. These clauses invoke specific inspectors which can return specific properties of the computer, its configuration, its file system, or other component of interest. In effect, the list of properties of the environment which may be referred to in the relevance language and verified by the advice reader is determined by the contents of the inspector library installed at run-time.

The existence of standard inspector libraries provides the advice provider with a rich vocabulary for describing the state of the consumer computer and its

environment. In one implementation, the collection of inspector libraries can be dynamically expanded by advice providers.

Advice readers operate continually in an automatic mode, gathering advice from many advice providers distributed across public networks such as the Internet, and diagnosing relevance as it occurs.

Advice readers following an advice gathering protocol, referred to herein as Anonymous Exhaustive Update Protocol, may operate in a manner which fully respects the privacy of the computer's owner. information resulting from the relevance determination, *i.e.* information obtained from the consumer computer, does not leak out to the server. Information on the consumer computer stays on the consumer computer unless the consumer approves its distribution.

15

10

Many variations on this specific embodiment are described in detail, including variations which have very different applications, very different message formats, very different gathering protocols, very different security and privacy attributes, very different methods of describing the consumers to whom a message may be relevant, and very different trust relationships between consumer and provider (e.g. master-slave relationships). The disclosed invention is shown to be capable of effective embodiment in all these settings.

DETAILED DESCRIPTION OF THE INVENTION

The invention implements a process of communication which systematically solves the problem of linking an information provider to information consumer.

The invention provides a system which depends on the use of computational devices connected by communications networks. In actual practice, these devices could range from traditional large-scale computers to personal computers to handheld personal information managers to embedded computational devices in the ambient environment, including consumer appliances such as remote controls and smart TVs, or other common computationally-dense environments, such as transportation vehicles. The communications mechanisms could include a modem or other wired media, or wireless communications, using the Internet or other protocols, and could include the physical distribution of media. Whatever the specific instance, for purposes of the discussion herein, the computational device shall be referred to as a computer and the communications infrastructure shall be referred to as a network. Typical examples of such infrastructure include intranets (private computer networks), and the Internet, the large public computer network that hosts the World Wide Web and related services.

20

25

15

5

10

The invention architecture is best understood if a specific terminology is adopted, which evokes a focused instance of the above described communications problem. The specific units of information to be shared henceforth are referred to as pieces of <u>advice</u> (see Fig. 1). The special digital documents conveying advice are referred to as <u>advisories</u>. An <u>advice provider</u> 10 is an organization or individual which offers information in the form of

10

15

advisories 12a-12d. The provider is represented by a server computer in a communicating network of computers. An <u>advice consumer</u> 14a-14c is an organization or individual which receives information in the form of advisories. The consumer is represented by a computer referred to as the consumer computer in a communicating network of computers.

It is helpful to think in concrete terms, and to suppose that the advice provider is in fact a large organization running a large-scale server computer; that the advice consumer is in fact an individual represented by a single personal computer, smart TV, personal information manager, or other personal computational device; and to suppose that the network of computers may communicate according to a protocol similar to the TCP/IP protocol now in use by the Internet. In actual practice, many variations can be expected. For example, an advice provider may constitute an individual represented by a personal computer, an advice consumer may be a corporation represented by a large-scale computing engine, and the communications process underlying the invention may be realized with other protocols operating over other physical means of communication.

Using this terminology, it is now possible to describe a key purpose of the invention. The invention allows one to relay advisories from advice providers to advice consumers. The communications protocol allows narrowly-focused targeting by automatically matching advisories with consumers for whom those advisories are relevant.

Relevance determination (see Fig. 2) is carried out by an applications program, referred to as the <u>advice reader</u> 20 which runs on the consumer computer and may automatically evaluate relevance based on a potentially complex combination of conditions, including:

5

 Hardware attributes. These are, for example, the type of computer on which the evaluation is performed, the type of hardware configuration 21, the capacity and uses of the hardware, the type of peripherals attached, and the attributes of peripherals.

10

 Configuration attributes. These are, for example, values of settings for variables defined in the system configuration 22, the types of software applications installed, the version numbers and other attributes of the software, and other details of the software installation 27.

15

 Database attributes. These are, for example, attributes of files 23 and databases on the computer where evaluation is performed, which may include existence, name, size, date of creation and modification, version, and contents.

20

Environmental attributes. These are, for example, attributes which can be
determined after querying attached peripherals to learn the state of the
environment in which the computer is located. Attributes may include
results of thermal, acoustic, optical, geographic positioning, and other
measuring devices.

10

15

- Computed attributes. These are, for example, attributes which can be
 determined after appropriate computations based on knowledge of
 hardware, configuration, and database and environmental attributes, by
 applying specific mathematico-logical formulas, or specific computational
 algorithms.
- Remote attributes 24. These are, for example, hardware, configuration, database, environmental, and computed attributes that are available by communicating with other computers having an affinity for the consumer or his computer.
- Timeliness 25. These are, for example, attributes based on the current time, or a time which has elapsed since a key event, such as relevance evaluation or advice gathering.
- Personal attributes. These are, for example, attributes about the human user(s) of the computer which can either be inferred by analysis of the hardware, the system configuration, the database attributes, the environmental attributes, the remote attributes, or else can be obtained by soliciting the information directly from the user(s) or their agents.
 - Randomization 26. These are, for example, attributes resulting from the application of random and pseudo-random number generators.

- Advice Attributes 27. These are, for example, attributes describing the configuration of the invention and the existence of certain advisories or types of advisories in the pool of advice.
- In this way, whatever information is actually on the consumer computer or reachable from the consumer computer may in principle be used to determine relevance. The information accessible in this way can be quite general, ranging from personal data to professional work product to the state of specific hardware devices. As a result, an extremely broad range of assertions can be made the subject of relevance determination.

The advice reader 30 (see Fig. 3) may operate automatically to determine relevance. It may present to the consumer a display of relevant advisories 32 only from several advice sites 33a-33c, so that the consumer is not burdened with the task of reading irrelevant advisories. In this way advisories may provide an automatic diagnosis 34 to any problem which a relevance clause may describe.

20 component, describing in terms the consumer can easily understand the reason that the advisory is relevant and the purpose and effects of the action which is being recommended to the consumer. These digital documents may also contain, as another component, executable computer programs, or links to executable computer programs. In this way advisories may provide an automatic solution to any problem which the relevance message may have diagnosed, and which may be activated at the consumer's discretion.

In short, the invention posits a situation where proactive advice providers identify situations of interest to consumers and provide advice about dealing with such situations.

5

10

15

20

25

Computer Technical Support Application.

To make the above generalities more concrete, a particular application area is described where this communications process may be of considerable utility (see Fig. 4).

In the technical support application, the advice provider offers a computer-related product or service, such as hardware, software, Internet service, or data processing service. The advice provider has a potentially large, potentially widely distributed customer base 40. In part from user input 42, the advice provider knows of problematic situations 41 which may affect certain computers belonging to the customers. The advice provider identifies these problematic situations 43, which may include the use of out-of-date versions of software, improper system settings, conflicting combinations of software applications, inadequate physical resources, corrupted files, other similar phenomena. The advice provider may know, for each problematic situation, a precise combination of hardware, system configuration, database configuration, timeliness, and other attributes which may signal the situation. The advice provider may know a precise solution 44 to each problematic situation, which may include:

- A suggestion to the user to modify usage patterns;
- A suggestion to the user to read a document;
- A proposal to upgrade to a new software version;
 - A proposal to modify system settings;
 - A proposal to run a certain script to effect a solution; or

 A proposal to download and execute special applications to correct the situation.

The advice provider authors an advisory 45, which is then preferably tested 46, and made available to relevant users at an advice site 47. In this way, the advice provider can use invention to reach the consumer population efficiently. The provider packages the information about the specific situation as a formal advisory concerning the situation. This digital document may include:

- A precise formal-language specification of conditions under which the situation occurs;
- Explanatory information intended for consumers who are in the given
 situation, describing to those consumers the situation they are in, the

implications of the situation, and the providers proposed actions to correct the situation; or

Digital content providing automatic solution or response.

5

The advice provider publishes the advisory 40 over the Internet or an Intranet, through an advice server running at the provider's advice site. For example (see Fig. 5), the advice site may comprise a directory of advice files 51a-51b and inspector files 52a-52b (discussed below). These advisories may be communicated to the outside world 54 via such media as a directory message server 55, an HTTP server 56, and FTP server 57, or a file server 58.

15

10

The advice consumer is a user of the products and services of the advice provider who knows of the advice provider's advice site and generally trusts the provider's organization and the advice that it authors. The advice consumer has available on his computer the advice reader application. The advice consumer instructs his advice reader to subscribe to the advice site offered by the advice provider.

20

25

The advice reader 20 (see Fig. 6), at scheduled intervals or under user manual control via a user interface 65, gathers advisories to which the user subscribes. Subscription to advisories are entered with a subscription manager 67 based, at least in part, on information in various user site definition files 68. Advisories are gathered from the advice provider's advice sites 33a-33b using a gatherer 60. The reader then parses the advisories using an unwrapper 61 and adds these advisories to any already existing

10

15

20

25

body of advisories. Advisories may be provided to the reader via any of several sources, including alternate input streams 62. The advice reader determines the relevance of any of the existing or new advisories with a relevance evaluation module 63. This determination is made either continuously, at scheduled intervals, or under user manual control. The advice reader includes a user interface 65 that receives relevant advisories and a display and management system 66 that displays relevant advisories for inspection by the consumer the relevant advisories. In some embodiments of the invention, an advisory may also be subject to digital verification using a verification module 64 (discussed in greater detail below).

A typical relevant advisory is reported to a consumer as follows:

Your computer has a certain combination of hardware and software and settings. Computers with this combination have frequently been reporting a particular problem. Our company has a solution. It will change your computer settings. If you accept to use this solution, your problem will go away. This solution has been rigorously tested before release, and represents our best known way of dealing with this problem.

The advice consumer reviews such relevant advisories 100 (see Fig. 7), and acts on the advisories 110, for example by ignoring the advisory 111. Otherwise, the user potentially deliberates, which deliberation may include informing himself further about the advisory or its author 112, informing others of the advisory 113, or taking some other offline action 114 and then,

10

25

depending on the outcome of the deliberation, he approves or denies approval. If the consumer gives approval, an automatic solution may result, which may involve a variety of activities, including software downloading 72, installation, and execution 71, an automatic electronic response 73, or the purchase or order of a digital object 70.

This particular application area shows how invention can be used to diagnose and fix problems on a computer automatically. There are many other applications areas of the invention, which may involve making commercial transactions rather than fixing computer problems, or offering new forms of private communications.

Responsiveness to Concerns

The invention is fully responsive to the concerns discussed above.

Provider Concerns

Large Scale Communications. In common with other computer-mediated communications systems, such as the world-wide web, the invention is able to reach a large number of consumers and convey to them a large body of informational messages, at low cost.

Automatic Operation. The matching of information to consumers is done without the need for case-by-case intervention of skilled human operatives.

Exclusive Targeting. The invention enables information to flow precisely to the appropriate consumers. The provider can guarantee this by carefully specifying the conditions under which a piece of advice is relevant.

Targeting with Intimate Knowledge. Information targeting in the invention is precisely focused on the attributes of the consumer because it has access to intimate knowledge of the inner details of the consumer computers state, without necessarily disclosing this knowledge to the provider. This degree of targeting is not possible under other protocols because other protocols require disclosure of this information to the provider to determine if a piece of information is relevant.

20

25

Consumer Concerns

The invention satisfies the main consumer concerns mentioned earlier.

Automatic Unattended Operation. The invention is an automated messaging system which operates successfully with infrequent consumer involvement. The advice reader can periodically gather new advice from advice sites that it subscribes to. This process may be fully automatic (manual intervention is also available). The databases of advice resident on the consumer computer may be continually evaluated for relevance by automated unattended operation of the advice reader.

Provision of Narrowly Targeted information. In a typical mode of operation, the consumer only sees information relevant to his precise attributes, including attributes derivable from the contents of his computer, associated peripherals and affiliated computers.

Timely Provision of information. In a typical mode of operation, a piece of advice may enter the consumer computer and remain resident for an extended period of time before becoming relevant. information is displayed when it has become applicable, not before it does.

Opportunity for Deliberation. Typically, the advice reader does not automatically apply a recommended solution operator. Rather, the advice reader gives the consumer the chance to study the diagnosis and recommendation, and to evaluate the credibility of the provider, before

10

proceeding. There are three special aspects to the deliberation process available in invention:

- Disclosure of Potential Risks. By exploiting known user interface methods, such as HTML display with hypertext links, the invention enables advice providers to inform consumers fully about potential risks associated with following a certain recommended course of action.
 - Discovery of Consumer Complaints. Via devices to be discussed below (such as the Better Advice Bureau) consumers may use the advisory mechanism to inform themselves about the existence of known and foreseeable privacy and security risks associated with specific advisories and/or advice providers before accepting proposed solutions.
- Correction of Known Defects. The invention allows advice providers to retract their own faulty advice. An instance of this is the UrgentAdviceNet mechanism (discussed below) for rapidly distributing advisories to the invention population.
- Automated Solution. Typically the advice provider authors an advisory in such a way that the advice reader offers it to the user to apply a recommended solution operator automatically after the user has given approval. Thus, the invention offers an automated solution to the user's condition under user guidance.

15

In short, the invention provides a mechanism to match consumers with highly specific relevant advisories efficiently in a communications structure which is responsive to consumer concerns.

5 Security and Privacy Technique: One-Way Membrane

The disclosed invention offers a comprehensive process for computed-relevance messaging. This is a broad idea, with many possible applications. In certain settings, this type of messaging must be implemented in a fashion which pays special attention to security and privacy concerns, *i.e.* a one-way membrane 35 (see Fig. 3). For a concrete instance, consider the technical support application (discussed above), where:

- Communication must take place over public networks such as the Internet;
- The advice provider is a large business or other concern; and
 - Advice consumers make up a widely distributed group of lay users.
- In this setting, consumers have special concerns about any process which functions as if it had intimate knowledge of the consumer's computer and its contents. These concerns are legitimate because the Internet is widely known as an insecure communications medium. Hence, systems which interact with the Internet, and which appear to function as if they had intimate knowledge about a user, might appear to enable privacy intrusions.

The invention addresses this problem by proposing a method of interaction between the consumer computer and the Internet which protects the consumer's privacy. This mechanism need not be used in other settings. For example, in certain private computer networks, commonly referred to as intranets, the invention has a variety of applications. In such settings, security and privacy are considered guaranteed by physical control of the computer and communications infrastructure involved, and possibly by contracts creating obligations on the participants in the process.

The invention employs a special protocol for subscription and gathering in the security and privacy critical setting. For purposes of the discussion herein, this setting is referred to as the Anonymous Exhaustive Update Protocol (AEUP). The intention of this interaction protocol is to create a one-way membrane, where information can enter the consumer computer in the form of advisories, but information about the consumer does not leave the consumer computer unless it is the consumer who initiates the transfer.

The AEUP protocol is described as the default protocol of the invention. The reasons that this protocol offers consumers privacy is discussed below. This document also describes many applications where security and privacy are not critical to acceptance by the consumer. Thus, it is possible to provide a certain degree of security and privacy protection without using this protocol. See below for a discussion of alternative protocols, such as the Anonymous Selective Update Protocol (ASUP).

25

A comprehensive discussion of privacy and security concerns is given below.

The invention addresses:

- Consumer Privacy Concerns. The invention fully respects consumer
 privacy concerns. In an implementation offering AEUP, consumers may benefit from narrowly-targeted advice without ever needing to reveal their identity, nor any of the attributes that were checked in determining relevance, nor the fact of relevance itself.
- Consumer Initiative. In a typical mode of operation, no advice is received by the advice reader unless the consumer initiated the subscription. This protects the consumer from unwanted communications.
- Privacy of Automatic Operations. Under AEUP, the operation of gathering advice from sites, the operation of evaluating relevance, and the operation of displaying relevant advice to the consumer need not result in the disclosure of consumer data to the advice provider.
- Frustration of Intrusions. Certain embodiments of the invention contain mechanisms, described below, to prevent compromises of privacy even in case of certain illegal eavesdropping activities
- Consumer Security Concerns. The invention fully respects consumer
 security concerns. In an implementation offering AEUP, consumers may

20

25

benefit from narrowly-targeted advice without exposing themselves to security threats from malicious sources.

- Consumer Initiates Subscriptions. In a typical mode of operation, no advice is received by the advice reader unless the consumer initiated the subscription. The process of subscription to an advice site connotes limited trust by the consumer for the provider. Hence, in typical operation, advice is only received from trusted sites.
- Harmlessness of Automatic Operations. Typically, the process of gathering and evaluating advisories has no noticeable effects on the computer system. Any recommended solution is applied only upon prior notification of the user and subsequent approval. Consumers who use invention to merely peruse relevant messages, but do not follow the recommended actions, face no significant risk.
 - Disclosure of Potential Risks. By exploiting known user interface methods, such as HTML display with hypertext links, the invention enable advice providers to inform consumers fully about potential risks associated with following a certain recommended course of action.
 - Discovery of Consumer Complaints. Via devices that are discussed below (such as the Better Advice Bureau), consumers may use the advisory mechanism disclosed herein to inform themselves about the existence of known and foreseeable privacy and security risks

10

15

associated with specific advisories and/or advice providers before accepting proposed solutions.

- Correction of Known Defects. The invention allows advice providers to retract their own faulty advice. It allows other people to criticize an advice providers faulty advice.
- Automated Solution. The advice provides typically authors an advisory in such a way that the advice reader offers to apply a recommended solution operator automatically to the user system after the user has given approval.

Thus, the invention provides a mechanism for efficiently matching consumer with highly specific relevant advisories in a communications structure which is responsive to consumer concerns.

Layers of Invention

The present document describes computed relevance messaging from many viewpoints, *i.e.* from one extreme of a general communications process to the other extreme of a set of specific protocols that have been implemented by Universe Communications, Inc. of Berkeley, California. It is worthwhile to classify the several layers of the invention as described herein:

25 Relevance Guided Messaging. The general communications process used by the invention has five elements (see Fig. 8):

10

15

- A Relevance Clause 80. An assertion about the state of a consumer computer, its contents, or environment which can be automatically evaluated by comparing the assertion with the consumer computer's actual state. Typically, the relevance clause is preceded by a subject line 82 which gives a general description of the advisory's subject matter.
 - An Associated message 81. A message or messages associated with the clause whose suitability for the consumer is determined at least partially by the evaluation of the clause.
 - A Gatherer 60 (see Fig. 6). An application that sees to it that relevance clauses flow into the consumer computer from various locations, perhaps by regular synchronization.

• A Watcher 63 (see Fig. 6). An application that has the ability to evaluate relevance clauses, *i.e.* assertions about consumer computer's own environment, by comparing them with the actual state of the environment, and by inspecting properties of the consumer computer and its environment and checking if these point towards or away from relevance.

 A Notifier 65, 66 (see Fig. 6). An application that has the ability to display messages to a user under at least partial guidance of an evaluated relevance clause.

25

A key difference of the invention from other targeted information providers is that the invention provides a detailed tool for tapping into very highly defined targets, which other protocols for targeting information cannot match because they do not routinely have access to the state of the consumer's environment.

5

The details of relevance guarded messaging are less important than this five-part model. For example, in one implementation, the five-part model is run on a computer network in a secure network such as a corporate intranet. In another implementation, the five-part model is run on a public computer network such as the Internet. Certain concerns that affect the public setting (e.g. security and privacy) might be completely irrelevant in the private setting, where those concerns are addressed by the physical control of the network. In either setting, the basic five-part model of relevance guarded messaging makes a valuable contribution to connecting providers with consumers.

15

20

25

10

It is important to note that this five-part model may have embodiments in which these five parts are not immediately evident. Potential implementations which make it clear that there can be many superficially different ways of achieving this basic structure are described below. For example, the relevance clause and the associated message may be packaged together in the same file and communicated simultaneously. In a different embodiment, the relevance guarded message can be communicated in two stages, where the first stage sends a relevance clause, and the second part is sent only if the first part leads to a relevant result and if the consumer computer asks the provider for the second part. Conceptually, the same useful effect can be

10

15

obtained using either of these two messaging protocols. Both methods are embodiments of the same invention.

Relevance Guarding with Security and Privacy. Owing to the tremendous importance of public networks, such as the Internet, an implementation of the five-part model which also addresses fundamental privacy and security concerns is of great significance. The mechanism by which the basic five-part model is extended (e.g. through AEUP, ASUP, or substantially equivalent protocols) to become a secure and private system over public networks is an important embodiment of the disclosed invention. It is potentially helpful for the broad consumer acceptance of computed relevance messaging.

Preferred Embodiment of the Invention. The presently preferred embodiment of the invention consists of a large collection of different interacting components, carefully designed to meet the goals underlying this system. The many subsystems illustrate the potential of the invention in the technical support application. Those skilled in the art will appreciate that there are many other applications to which the invention may be put.

Variant Implementations. The specific implementation was arrived at after a long series of different application areas were examined and carefully studied. This document describes in considerable detail a large number of variant implementations modify the basic operation of the central implementation for other market areas or other demands. For example, in certain settings, the use of low communications bandwidth is important and privacy is unimportant. A variation for that setting is discussed below.

Invention Components

The following discussion describes the key components in what is currently regarded as the best mode of implementing the disclosed invention. In this implementation it is assumed that communications are via standard Internet techniques, and that the advice provider and advice consumer are both relying upon standard network connected computers.

10 Advice Provider Components

The following is a listing of component names, followed in various subsections by a brief discussion of each component:

- 15 advice site
 - advisories
 - site signature

20

- site description file
- inspector library files
- supplementary files

While these general components may be implemented in many ways, it easiest to describe their form and function in the currently understood best mode, based on the use of Internet communications protocols. Those skilled in the art will appreciate that this is not the only possible implementation.

5

10

advice site

This is a standard place on the Internet (see Fig. 5), *e.g.* a URL-addressable directory on a server computer, combined with server software that responds to certain TCP/IP requests for information.

The site directory may contain a plurality of files, including advisories, digests of advisories, and inspector libraries.

The software associated with the server may perform the functions of an HTTP server, an FTP server, or a file server, thereby providing access to the files stored in the directory using well-known communications protocols. The software associated with the server may also perform the functions of a specialized server, implementing invention-specific communications protocols.

20

These protocols may include:

 The ability to serve a directory message describing the contents of the site directory, including filenames, sizes, and dates;

- The ability to serve an abstract message which describes in abbreviated form the contents of the files in the directory;
- The ability to engage in security handshaking;

- The ability to perform challenges to advice readers to validate their authenticity; and
- The ability to meter traffic through the site, and compute summaries of traffic levels.

The function of advice site server software is to process certain requests made by an advice reader running on a consumer computer. The advice reader may request information about the directory of the site, may ask for abstracts of advisories, and may ask for contents of individual advisories. The transaction between advice server and advice reader is described further below.

Advisories

20

15

The advisories in an advice site are digital files. Advisories typically have some of the following components:

A relevance precondition written in a formal relevance language, which is
 used to describe attributes of a computer and/or its contents and/or its
 environment. For more information on the relevance language, see below.

 A humanly-intelligible component which may summarize the purpose of the message, may describe the author, may explain the precondition in human language, and may explain the solution in human language.

5

10

15

• A computer-intelligible component which potentially offers either software tools to solve the problem or Internet access to software tools solving the problem. In the currently understood best method for this implementation, an advisory is a specially formatted ASCII file built using the MIME Internet standards track specification documented in RFC 1521 et seq. (see N. Borenstein, N. Freed, MIME (Multipurpose Internet Mail Extensions) Part One: Mechanisms for Specifying and Describing the Format of Internet Message Bodies, Internet Standards Track RFC 1521(1993)). This format is currently used for transport of Internet mail; it contains headers documenting the sender of the message and its subject, and mechanisms for including digital signatures. A MIME file is easily transported over the Internet and is easily broken into its constituent components using parsing algorithms well-known in the Internet community. The advisory file format is described further below (see, also A Guide to Writing Advisories for

AdviceNet, Universe Communications, Inc., Berkeley, CA. (1998)).

20

Authoring Advisories.

Site Signature

10

15

25

Associated with an advice site may be a certain digital signature mechanism, for example one of the standard signature mechanisms using public-key/private-key pairs. The signature mechanism may be used to sign advisories in a fashion that allows advice readers to verify that the advisory was in fact authored by the advice provider.

Site description files

The site description file (SDF) is a specially structured ASCII text file authored by the advice provider. It describes the provider's advice site and serves as the basis for a consumer to initiate a subscription. This file specifies the site location (URL), the site name, and site security characteristics, such as whether the site avows only advice which has been digitally signed. It also provides various parameters of the subscription process intended for use by the advice reader (for example, the recommended frequency of synchronization, and the type of subscription relationship (free/fee)). It may contain humanly interpretable text indicating the purpose of the site.

The SDF may also contain the public key associated with advice authored by
the site. This public key is needed to verify signatures on advice authored by
the site.

The SDF may also be signed by a trusted authority, to establish the authenticity of this site description file. For example, it may be signed by advisories.com or the Better Advice Bureau: see below.

The SDF may also contain a ratings block, provided by a trusted ratings service, to establish trust in the respect for privacy and security and the usefulness of advice at this site. See, for example, below.

10

15

20

inspector libraries

inspector libraries are libraries of special purpose executable code, which may be accessed by advice readers for the purpose of extending the capabilities of the relevance language. In effect, inspector libraries provide a mechanism for advice site specific extensions to the relevance language.

Supplementary files

The contents of the advice site discussed so far play important roles in the ordinary conduct of the invention. In one typical implementation, additional files may be present in the advice site directory. In such an implementation, data and applications files which do not play a role in the conduct of the invention *per se* may be included in the advice site directory. These files are distributed as are other files at the advice site. This implementation allows the distribution of installers, uninstallers, shell scripts, JAVA, and Visual Basic programs, *i.e.* in general, packages of data, applications, and other resources, that may play a supporting role in evaluating and following advice issued at the site. For example, such additional files may play a role as databases searched by the advice provider's own inspector libraries or as applications used in implementing the advice providers recommended solutions.

Advice Consumer Components

The following is a listing of component names from the advice consumer perspective, followed in various subsections by a brief discussion of each component:

- 5 advice reader
 - subscription database
 - advice database

10

- user profile
- inspectors
- 15 solution wizards
 - advice reader

The advice reader is an application running on the consumer computer. It is responsible for liaison with the advice site and for managing interactions with the user. The advice reader maintains a directory of files on the consumer computer. Inside that directory are contained various files described below which are used/managed in the course of advice reader operation.

The advice reader has a number of jobs, which are listed below without elaboration:

- Manage subscriptions
- Synchronize with advice site

- Gather advisory files
- Unwrap advisory messages
- 10 Manage advice Database
 - Manage relevance Evaluation
 - Evaluate relevance of Individual advisories

15

- Invoke inspectors
- Display relevant advisories to User
- 20 The process is described in detail below.

Subscription Database

The advice reader maintains a database of subscription information which allows for the scheduling and conduct of site synchronization by the gatherer

component. The subscription database contains information about the address of the advice site; information and recommendations provided by the advice sites site description file, such as recommended frequency of synchronization; information needed to verify digital signatures associated with the advice site; and information associated with the users experience with the advice site.

Advice Database

The advice reader maintains a database of advice that has been received from various advice sites. These may be indexed according to the site from which they were received according to the systems that the advice concerns, or according to other principles which would be helpful to the consumer or to the author.

15

20

5

The advice reader may organize advice into pools of advice which share a common basis for treatment. Examples of this principle include a pool of advice specially targeted to the concerns of one user of a multi-user consumer computer, a pool of advice scheduled for manual relevance evaluation only, and a pool of advice scheduled for nightly evaluation at a certain time.

User Profile

The advice reader maintains a special file or files containing data which have been obtained from interviews with the user, deduced from his actions, or

deduced from the properties of the computer or its environment. Such data may describe the computer or its environment, and may also describe preferences, interests, requirements, capabilities, and possessions and plans of the user, including things unrelated to computer operations.

5

15

The file or files may be encrypted. The file or files may be organized by advice site so that they describe interests, preferences, and so forth to be accessed by relevance queries associated with a specific site only.

10 inspectors

inspector libraries contain executable code which may be invoked by the advice reader as part of the relevance evaluation process. Inspectors can examine properties of the consumer computer, storage devices, peripherals, environment, or remote affiliated computers. These are further described below.

10

15

20

25

Solution Wizards

Solution wizards support the process of automated solution. They are applications which can perform stereotyped functions that are frequently of use for solving problems on computers. These are described further below.

Transaction Overview

The following discussion describes the basic model for an Internet-based transaction using the invention.

Subscription Model

In the invention, the initiative to begin an interaction typically comes from the consumer. The consumer becomes aware of the existence of an advice provider and associated advice site(s), for example, as part of installing a new hardware or software product on his computer, or as a result of advertising, or sharing experiences with other consumers. The consumer, after potentially informing himself about the kind of advice being offered at that site and its reliability, makes a decision to subscribe. The consumer, interacting with a piece of the advice reader called the subscription manager 67 (see Fig. 6), configures the advice reader to subscribe to the given advice site, by supplying it with either the corresponding site description file 68, or with a pointer to such a file, or with a pointer to the site itself which contains an instance of such a file. The consumer, after studying the terms of interaction

recommended in the SDF, configures the parameters associated with the subscription, which control how frequently advice from the site is gathered.

10

15

20

25

Advice Gathering Using AEUP

Periodically, under the terms of the subscription, or manually under user control, the advice reader initiates a site synchronization. A component of the advice reader, referred to as the gatherer, has the duty to synchronize the consumer site image with the current image of the advice site. These states can be different if the advice site has retracted advice or authored new advice since the most recent synchronization. The gatherer makes sure that there is a one-to-one correspondence between advisories at the advice site and advisories in the consumer machine. The gatherer opens a connection to the directory message server at the advice site. After an optional security handshake to verify the authenticity of the advice reader and server, the gatherer queries the server for a directory message. The gatherer inspects the response and checks whether the site directory has changed since the previous synchronization. If not, there is no need to obtain any files from the advice site, and the session may end. If the directory has changed, or if this is the first synchronization ever, the gatherer initiates FTP and/or HTTP and/or file server access to the new files. The gatherer also deletes any advisories on the consumer computer which no longer correspond to advisories on the server, and this terminates the synchronization of the consumer site image with the true site image.

The protocol just described is the AEUP protocol that is described above. The gatherer is allowed, by the advice server, to gather all the files at the advice site anonymously or, at any rate, all files which have not previously been gathered. The intention is that the advice stored on the consumer

10

15

machine consists at any given moment of all the advisories offered at the advice site at the time of the last synchronization, other than those that the user has specifically deleted. Hence, there is no selective gathering. Rather, gathering is exhaustive, *i.e.* every piece of advice is gathered. The implications of this protocol and alternative protocols are discussed below.

Unpacking Advisories

As described below, an advisory file is a potentially complex hierarchical structure, which may contain one or more than one message. The advice reader unpacks all the components of this structure. Components of the structure may be signed using a digital signature method, *i.e.* at unpacking time those signatures are verified. After unpacking, the advisories are entered in a pool of all advice, old and new, to be evaluated. In one typical implementation, the invention may suppress entry into the system of unsigned advisories or of advisories whose signatures cannot be verified.

Relevance Evaluation

As a matter separate from gathering, the pool of all advice to be evaluated may be processed, either continuously, or according to a consumer-defined schedule, or an immediate user request, or some specified trigger event (see Fig. 9). The advice reader parses the individual message and identifies the clauses determining relevance. These clauses are expressions in the formal relevance language which is described below. The advice reader parses the clauses using an expression tree generator 91 into a tree of elementary

subexpressions (see Fig. 10) and then evaluates each subexpression of the tree using an expression tree evaluator. If evaluation proceeds successfully and results in a value of True, the message is deemed relevant 93. A dispatch method 94 is then used to consume the advisory which may include a file system inspector that identifies appropriate directory and file name references 96 in various user volumes 97, 98; a registry inspector 99 that inspects an operating system registry 120; an operating system inspector 121 that inspects various system elements 122; or a hardware device inspector 123 that inspects various system devices 124.

Inspectors

Evaluation of subexpressions is performed by methods called inspectors (see Fig. 11) which may perform mathematico-logical calculations, execute computational algorithms, return the results of system calls, access the contents of storage devices, and query devices or remote computers. These methods are called inspectors because a frequent purpose is to inspect the properties of the consumer computer, its configuration, or contents of its storage devices. Inspectors may come built in to the reader, and may also be plugged in via DLL or similar mechanisms. Thus, an object 130, property name 131, and/or string selector 132 is dispatched to a reader using a method dispatch module 134 in accordance with dispatch information contained within a method dispatch table 133. Various inspectors 135, 136 are provided at a user location, each of which includes an inspector library 137, 139 and associated methods 138, 140. Inspectors are described in greater detail below.

User Interface

5

10

15

20

After relevance has been decided for an item in the advice pool, a relevant item may be entered into a list of items to be displayed. This list may be displayed to the consumer according to typical user-interface models. The user-interface may inform the user about the author of the advisory, about the date the advisory was acquired, about the date the advisory became relevant, about the subject of the advisory, and about other attributes of the advisory message. The user interface may offer the user to display the explanatory content of individual advisories. Depending on the advisory, the explanatory content may contain simple text explanations, or may contain more elaborate multimedia explanations. Depending on the advisory, the explanation may identify the situation which caused the advisory to be relevant, the implications of relevance, the recommended action or actions to take at this point, the anticipated effects of taking those actions or of not taking them, or the experiences of other users or other organizations with the proposed actions. The user studies this explanatory content, perhaps performing additional research (for example studying the trustworthiness of the provider, or the opinions of other users).

Recommended Response

As part of the display of a relevant advisory, the user is typically offered the possibility of an action in response to the situation. Possible outcomes include:

 consumer ignores information/proposal. The consumer reviews the advisory, decides he does not wish to pursue it, ignores the content, and deletes the advisory.

5

10

- consumer is notified. The consumer reviews the advisory, or some other document it refers to, and learns something important or interesting.
- consumer is entertained. The consumer reviews the advisory, or some other document it refers to, or some multimedia content it contains, or some multimedia content it refers to, and is exposed to a stimulating presentation.
- consumer forwards information to another. This may include friends,
 family, colleagues, or associates. Forwarding may involve off line transport or electronic transport, such as e-mail.
 - consumer initiates correspondence with provider or other. This may include contact by mail, phone, fax, or e-mail. This may also include participation in an information exchange, including for technical support, training, or market survey purposes, as well as participation in a sale or other commercial interaction.
 - consumer initiates on-line participation in a timely event.

25

20

- consumer purchases object by e-commerce. This may include a purchase entered by clicking on a button in the advice reader window which entry to e-commerce mode.
- consumer fills out a form. This may include a form rendered by a Web browser, or a text file form intended to be returned by e-mail, or a form intended to be filled out and faxed or mailed back.
 - consumer initiates off line action in real world. This may include any off line
 action ranging from actions associated with the computer modifying the
 state of hardware devices, gathering information in the environment
 surrounding the computer, or reading some instructions in a manual before
 beginning an online process. This action may also include purely personal
 items.

10

consumer modifies system setting or data field on computer. This may
involve the consumer executing a series of manual operations on the
computer to change settings of some system component or software
application or to modify an entry in a database.

20

25

consumer initiates an Install/Uninstall/Execute solution. This may involve
the consumer clicking on a button in the advice reader, followed by
automatic execution of a sequence of download/install/uninstall/execute
steps, or it may require the consumer to access physical media such as
floppy disk or CD-ROM to perform an install under direct supervision. It

10

15

20

may involve automatic execution, or execution under user control, following instructions indicated for the user by the advisory.

consumer invokes Script file for solution. The advisory may offer a series
of instructions in a high-level system-affecting language, such as
AppleScript, DOS Shell, UNIX Shell, Visual Basic, which the consumer is
expected to store as a file and then pass to a standard interpreter (e.g.
AppleScript Editor, DOS Command Line Interpreter, UNIX Shell Command
Line Interpreter, or Visual basic Interpreter). This action may alternatively
involve the consumer executing a series of manual operations on the
computer that involve typing in commands one by one in a certain window
of a certain application.

Many concrete outcomes can be grouped among the outcomes in this list.

Advisory File Format

The advisory file format provides a mechanism to encode one single advisory or several advisories for transport across computer networks and other digital transport media, and to offer one or several variants of same basic explanatory material. The following discussion describes the components of an advisory in general terms and describes the currently understood best method for implementing advisories using MIME.

25 Components of a Basic advisory

The most elementary advisory may have these logical components (see Fig. 8):

- Wrapper. Components designed to package the information for transport
 and subsequent decoding.
 - From Line. Component identifying the advice author.
 - Subject Line. Component identifying briefly the concern of the advisory.

10

- Relevance Clause. Component in the formal relevance language precisely specifying the conditions under which the advisory could be relevant.
- Message Body. Component providing explanatory material potentially
 explaining to the user what condition has been found relevant, why the user is concerned, and what action is recommended.
 - Action Button. Component providing the user the ability to invoke an automatic execution of the recommended action.

20

Clause Variations

Elaboration on the basic scheme may also be valuable:

- The advisory may contain an expires-when clause. This is an expression
 in the formal relevance language which causes the message to expire if it
 evaluates to True.
- The advisory may contain an evaluate-when clause. This is an expression
 in the formal relevance language which causes the message to be
 evaluated for relevance if it evaluates to True.
- The advisory may contain an requires-inspector-library clause. This may
 give the name of an inspector library and a URL where it can be found.
 This indicates that a certain inspector library must be installed for relevance to be evaluated correctly.
- The advisory may contain a refers-to clause, giving keyword labeling of
 systems referenced by the condition associated with the advisory.
 - The advisory may contain a solution-affects clause, giving keyword labeling of possible effects of the recommended response.
- Other variations may be recognized as useful in the future. Such variations are not excluded from the scope of the invention.

Display Variations

25 The message body may occur in at least three forms:

Text. The explanatory material may be an unconstrained ASCII text document. This has no embedded variations in presentation style (*e.g.* no changes in font and/or no hypertext references to outside documents).

HTML. The explanatory material making up the message body may be an HTML document. This is familiar from Web browsers. HTML documents may contain variations in the presentation of text, may contain tables and visual formatting features, may contain references to external documents, and may contain references to external graphics files.

10

25

Text/HTML. The explanatory material making up the message body may be given in both text and HTML forms. The advice reader has the option of using whichever form is more appropriate to the user.

Further variations in message content, including audio and video content, are not excluded from the scope of the invention.

Digital Integrity and Authenticity

The message body may have digital authentication features appended to the message to insure its integrity and authenticity.

A digital digest may be appended to the message to ensure message integrity. At the time that the message is compiled by the author, a specialized functional of the message body may be computed and appended to the message. The recipient of the message can verify the integrity of the

message by computing the same functional and verifying that it produces the same result as that appended to the message. Known examples of digital digests include CRC, MD5, and SHA.

Digital digests are familiar in the computer programming community under the name hashing. The idea is that certain mathematical operations based on modular arithmetic are applied to a numerical representation of a body of text, producing a numerical output ranging in magnitude from a small number to a number requiring some dozens of digits to represent, depending upon the details of the digest mechanism. These arithmetic operations typically produce an output which depends on the original body of text in a discontinuous way which is not easily invertible. That is, slightly different messages tend to have very different digests. Also, it may be difficult to find any two messages with the same digest, and if one of the two messages is previously specified, it is particularly difficult to find another message which happens to have the same digest.

The practical implication is that a transmission or recording error which causes the advisory document to be modified in some way from the authors original intent does not typically result in a modified document that generates the appropriate digital digest. In this way, modified documents can be identified and suppressed from consideration.

A digital signature may be appended to the message to ensure message authenticity (see C. Pfleeger, <u>Security in Computing</u>, Second Edition, Prentice-Hall (1996); and <u>PGP 4.0 Users Manual</u>, PGP Pretty Good Privacy,

Inc. (1997)). This is a refinement of the digital digest idea, rendering the digest secure against malicious tampering.

Digital signatures generally work as follows: At the time that the message is compiled by the author, a digital digest of the message is calculated. The digest is then encrypted using an encryption scheme that is well known and widely associated with the advice site. The encrypted digest is considered the advice site's signature on the message, and is appended to the message itself, labeled as a signature.

10

15

20

5

The advice reader, in seeking to verify the signature of the site, attempts to decrypt the signature using the well-known decryption algorithm associated with the advice site. A successful decryption produces a digital digest which agrees with the value that the advice reader calculates directly from the message. An unsuccessful decryption produces a result that does not agree with the digital digest of the received message.

It is commonly accepted (see C. Pfleeger, <u>Security in Computing</u>, Second Edition, Prentice-Hall (1996); and <u>PGP 4.0 Users Manual</u>, PGP Pretty Good Privacy, Inc. (1997)) that this approach, when used in conjunction with certain well-know encryption systems, produces a secure digital document. That is, it is accepted that a malicious agent cannot easily modify a given valid advisory to produce an impostor advisory which produce a successful decryption.

Indeed, to deceive this system successfully, it is necessary for the impostor to generate the digital digest of the modified document correctly and then apply

the encryption algorithm associated with the advice site. While the impostor may be assumed to have learned the workings of the digital digest mechanism, it is assumed that he is not able to encrypt documents as if he were the advice site.

5

10

15

20

25

The fundamental assumption of modern cryptography systems as applied to public communication is that certain encryption/decryption algorithms can have widely known decryption algorithms and keep the encryption algorithms secret. Until this fundamental assumption is disproved, the digital signature mechanism is widely considered an effective authentication mechanism.

MIME

In the currently understood best method for structuring advice for Internet transport, an advisory document is packaged as a single ASCII text file which is a valid instance of MIME file (see N. Borenstein, N. Freed, MIME (Multipurpose Internet Mail Extensions) Part One: Mechanisms for Specifying and Describing the Format of Internet Message Bodies, Internet Standards Track RFC 1521 (1993)). Actually, only a special subset of the full MIME format is used. Special extensions to MIME are added to accommodate the invention.

MIME is an Internet standards track format extending the classical e-mail Internet standard commonly referred to as RFC 822. The MIME format is widely used for Internet transport of electronic mail. It has four features of particular usefulness in connection with advisories:

Header Lines. MIME specifies that a message body may be preceded by an extensive message header consisting of a variety of header lines, where individual lines begin with a well known phrase and contain addressing, dating, and related commentary. Some of these lines can be easily adapted to serve the purposes of the invention. For example, the From Line and Subject Line components of an advisory can be implemented by the From: and Subject: header lines that are already part of the MIME standard.

Extensibility. MIME provides a method for creating new message lines in messages. This includes a method for embedding the new message lines in messages and a method for registering the new line with the MIME authorities. Key invention constructs relevant-when and expires-when may therefore easily be added to the MIME language in that fashion.

15

20

25

5

Alternation. MIME provides a method, *i.e.* Multipart-Alternate, for offering two different versions of the same message, with the destination picking the appropriate display method. Therefore, the invention construct of transmitting one or more ways to display the same information may easily be implemented using the MIME standard and its Multipart-Alternate feature.

Digesting Mechanism. MIME provides a well-understood mechanism, *i.e.* Multipart/mixed, for packing several complete MIME messages into a single file for Internet transport. MIME posits a recursive digest structure, in which a message can have several related components, and each component can itself be a MIME file inserted verbatim. Using this feature, a MIME file can

10

15

20

25

be used to digest many component advisories, organized in a tree structure reminiscent of the branching structure of a modern personal computer file system.

Thus, MIME becomes a tool, not for packaging e-mail, but instead for packaging a new kind of document, i.e. the advisory. To avoid confusion, it should be appreciated that an advisory is unlike e-mail because an advisory does not have an intended recipient or list of recipients. Rather, it is a broadcast message. An advisory typically has relevance and related clauses, and an advisory typically has active content. E-mail does not have relevance and related clauses, and does not typically have active content. The advisory is part of a new form of communications which can be implemented within the MIME standard. The advisory application of MIME addresses a different problem than e-mail by omitting certain MIME clauses which were used for email, and by adding new specialized clauses which are used in the relevance determination and advice management process. In a certain sense, the relationship of advisories to e-mail is comparable to the relationship between USENET and e-mail. Both advisories and USENET news systems use MIME as a packaging mechanism. However, both offer means of communications which are distinct from e-mail.

Although MIME is a convenient method of realizing the form of an advisory, there is no necessary connection of the invention to MIME. There are many other common formats in the Internet world, such as XML, which may be used for representing advisories. In this disclosure, only the currently understood best method for implementing the advice file is discussed.

Example

The following is an example of an advisory file:

5

Date: Sat Mar 21 1998 17:06:12 +0800

From: Jeremiah Adviser < jeremiah @ advisories.com>

MIME-Version 1.0

Organization: Universe Communications, Inc.

Subject: A better version of the advice reader is now available

relevant-When: version of application "advice.exe" < version "5.0"

Content-Type: text/html; charset=us-ascii

<HTML><BODY>

A better version of the advice reader is available.

Click to

Download the latest version of advice reader.

</BODY></HTML>

- Here the reader can see the various components of an advisory embodied as MIME components:
 - Wrapper. MIME-Version and Content-Type header lines.
- From Line. From: Jeremiah Adviser ...

• Subject Line. Subject: A better version of ...

Message Body. An HTML fragment, beginning <HTML> and ending

</HTML>.

· Action Button. Not present in this advisory. The active component of the

message (downloading) is handled by the HTML HREF link. The user

sees the word Download and typically understands that a mouse click on

that word causes the indicated action.

10

15

5

Ratings Blocks

In an additional variation, it is possible for an advisory to contain ratings

blocks containing information rating the advisory according to criteria such as

privacy, security, and usefulness. There exist standard formats for such

ratings blocks (see Khare, Rohit, Digital Signature Label Architecture, The

World Wide Web Journal, Vol. 2, Number 3, pp. 49-64 Oreilly (Summer 1997),

http://www.w3.org/DSIG) and these are easily appended to messages with

MIME structure. See also below.

20

25

Relevance Language

Advisories have a format resembling the format of e-mail messages, with

many of the same components in the message/digest headers. One key

extension offered by advisories is the institution of a new clause in the

message, i.e. the relevance clause. The relevance clause is preceded by the

62

keyword phrase relevant-When:. An expression from the relevance language follows the keyword. The following discussion describes the currently understood best method for describing the state of a consumer computer.

5 <u>Descriptive Language</u>

The purpose of a relevance clause is to examine the state of an individual computer and determine whether it meets various conditions which combine to imply the relevance of a certain advisory.

10

15

In the currently understood best method for implementing the invention, the language itself, *i.e.* in the allowable phrases of the language and the underlying semantics of the phrases, provides an intellectual model of the components of the consumer computer, its peripherals, storage devices, files, and related concepts. This is distinct from the usual model of computer languages, in which the language itself provides a rather meager picture of the problem it is used to address.

In common with traditional languages, the relevance language contains a few elementary data types, such as Boolean, integer, and string. Also in common with traditional languages, it is permissible to write arithmetico-logical expressions such as:

$$(2346 + (-1234) / (1 + 2)) > 0$$

25

10

20

25

The meaning of a typical subexpression, *e.g.* 1+2, is apply method + to the pair of objects resulting from evaluating the two subexpressions 1 and 2. The pair of objects in question are objects of type Integer having values of 1 and 2, respectively. In the currently understood best method, the relevance language has a full range of arithmetic, string, and logical operations available, which are expressed as built in methods set to operate on the built in concrete data types (see Fig. 12).

Unlike traditional languages, the relevance language contains an abstract data type, World, which may be thought of as the overall environment of the personal computer on which the relevance clause is evaluated. This object has properties. These properties yield objects of various types, and these objects may have further properties (see Fig. 13).

World is a data type that, depending on the specific implementation and on the specific system configuration, may have many properties.

In the technical support application discussed above, these properties may include the system folder property, the CPU property, and the monitor property. Properties of an object are obtained by applying assessor methods to the object. The assessor method for the system folder of data type World returns an object of type system folder. The assessor method for the CPU property of data type World returns an object of type CPU. These derived objects, in turn, have properties of their own. For example, an object of type CPU may have a collection of properties such as speed, manufacturer, model, MMX, and cache. A method corresponds to each of these properties which,

when applied to the object of type CPU, returns a result. For sake of discussion, it can be assumed that speed results in an integer, manufacturer results in a string naming the manufacturer, model results also in a string, naming the model type, and MMX and cache return the more specialized object types MMX, and cache.

The relevance language implicitly postulates that the set of inspectable properties of the consumer computer is identical to the set of properties of data type World and the set of properties derivable from World by repeated applications of asking for properties of an object derived from World (see Fig. 14). ObjectWorld gives an idea of the richness of the object world derivable in this way in the technical support application.

Example Relevance Clauses

15

10

5

The following are examples of relevance clauses as used in a technical support application:

Existence of a certain application on the consumer computer

20

25

relevant-When: exists application "Photoshop"

The intent of this fragment is that <u>application</u> is a property of World which takes an extra string parameter and returns an object of type application. <u>exists</u> is a property of any object, which returns the Boolean True if the object exists. If the application named Photoshop cannot be found by the method

implementing the application property, then the result is a non-existent object, for which exists returns the Boolean False.

Comparison of version numbers

relevant-When: version of Control Panel "MacTCP" is version "2.02"

The intent of this fragment is that Control Panel is a property of the World 5 which takes an extra string parameter and returns an object of type Control Panel. If the Control Panel named MacTCP cannot be found by the method implementing the Control Panel property, then the result is a non-existent object, for which version is not an allowed property, and evaluation fails. If the Control Panel named MacTCP is found, then version, being an allowable 10 property of Control Panels, leads to invocation of a method which returns an object of type version containing the version number of that Control Panel, recorded in a particular format. This result is compared with the result of subexpression version "2.02". This time version refers to a property of World, which takes an extra string parameter and returns an object of type version. If 15 evaluation succeeds, the result of this comparison is Boolean: either True or False.

Compare modification dates

20

25

relevant-When: modification time of Photoshop PlugIn "Picture Enhancer" is greater than time "10 January 1997 12:34:56 +0800"

The intent of this fragment is that <u>Photoshop Plugln</u> is a property of the World which takes an extra string parameter and returns an object of type Photoshop Plugln. If the Photoshop Plugln named PictureEnhancer cannot be

10

15

found by the method implementing the Photoshop Plugln property, then the result is a non-existent object, for which modification time is not an allowed property, and evaluation fails. If the Photoshop Plugln named PictureEnhancer is found, then modification time, being an allowable property of a Photoshop Plugln, leads to invocation of a method which returns an object of type time. This result is compared with the result of subexpression time "10 January 1997". Here, time refers to a property of World which takes an extra string parameter and returns an object of type time. If evaluation succeeds, the result of this whole expression is Boolean: either True or False.

Automatic Parsing and Evaluation

A key purpose of the relevance language is to enable an advice provider to publish advisories which can be accessed by the advice reader, running on a consumer computer, and be automatically read to determine, without intervention from the consumer, whether the advisory is relevant to the consumer.

In the currently understood best-method, the relevance language is implemented as a context free grammar which can be automatically parsed into a tree of subexpressions. The tree of subexpressions can be understood as an abstract structure whose nodes are methods and whose branches are subexpressions.

25

This tree is represented using a standard notation in computer science:

where node gives the name of the method to be applied, and (expr-k) stands
for the k-th subexpression to be furnished to the method. For example, the
expression:

$$(2346 + (-1234)/(1 + 2)) > 0$$

can be parsed into the expression tree:

```
(Integer 2346)
     (>
                   (+
                         (/
                                (Integer -1234)
                                              (Integer 1) (Integer 2))
5
                                (+
                          )
                   )
                   (Integer 0)
      )
10
      The expression:
            exists application "Photoshop"
15
      can be parsed into:
                        (application "Photoshop"))
             (exists
      The expression version of Control Panel "MacTCP" is version "2.02" parses
20
      into:
             (version (Control-Panel "MacTCP"))
      (is
             (version (string "2.02"))
      )
25
```

Finally, the expression:

modification time of Photoshop Plugln "Picture Enhancer" is greater than time "10 January 1997"

5 parses into

```
(is-greater-than (modification-time (Photoshop-PlugIn "Picture Enhancer"))

(time (string "10 January 1997"))
```

10)

In short, the goal of parsing is to identify a sequence of method invocations to be applied. Procedures for parsing context-free grammars into expression trees are well-understood (see A. Aho, J. Ullman, <u>Principles of Compiler Design</u>, Addison-Wesley (1977)). A lexer breaks the input into a series of tokens. In the currently understood best method, these tokens may take of the following forms:

[String] A string of printable ASCII characters enclosed in quotation marks (").

20

15

[Integer] A string of decimal digits.

[Minus] The character -.

25 [SumOp] The characters +-.

[PrdOp] The characters */ and the string mod.

[RelOp] The character sequences = > > = < = ! =and the relational phrases and or is not.

5

[Phrase] A sequence of one or more unquoted words, a word being an alphanumeric string beginning alphabetically and not containing embedded blanks. Phrases break at reserved phrases.

Parsing proceeds mechanically according to a precedence table giving the productions of a grammar. In the currently understood best method, the productions in the grammar are as follows:

:= <Expr> <Goal> := <Expr> or <AndClause> | <AndClause> 15 <Expr> := <AndClause> and <Relation> | <Relation> <AndClause> <SumClause>[RelOp]<SumClause> <Relation> <SumClause> := <SumClause> [SumOp] <Product> <SumClause> <SumClause> [Minus] <Product> 20 <Product> := <Product> [PrdOp] <Unary> <Product> | <Unary> := [Minus] <Unary> <Unary> | [UnyOp] <Unary> 25 | <Cast>

:= <Cast> as [Phrase] <Cast> | <Reference> := [Phrase] of <Reference> <Reference> | [Phrase] [string] <Restrict> of <Reference> | [Phrase] [integer] < Restrict> of < Reference> 5 | [Phrase] [string] of <Reference> | [Phrase] [integer] of <Reference> | [Phrase] < Restrict> of < Reference> | [Phrase] [string] | [Phrase] [integer] 10 | [Phrase] <Restrict> [Phrase] exists <Reference> number of <Reference> [string] 15 [integer] | it (<Expr>) := whose (<Expr>) <Restrict>

In this display, <u>word</u> stands for a reserved word in the language, [Phrase] stands for a phrase as defined in the discussion of lexical analysis on the previous page.

A grammar can be used to generate a parser by any of several means (see A. Aho, J. Ullman, <u>Principles of Compiler Design</u>, Addison-Wesley (1977)).

These may include automatic parser generators, such as YACC, which create a table driven finite state automaton that recognizes the grammar. The table is created directly from the production forms above, and also by hand generation of recursive descent parsers based on mimicking the productions of the grammar in modules whose naming and internal structure mimic the structure of the productions of the grammar.

All such approaches have the same basic result. New tokens are input, one-at-a-time, and compared with the current state and also with a table giving allowable type and mandated action on receiving that token, if any. The mandated action can be interpreted as specifying the individual steps in the systematic building up of an expression tree. A typical action is that associated with the production:

which could be written, in a standard notation, as:

20

25

5

10

This is interpreted as follows: \$\$ refers to the result of the production, \$1, \$2, \$3 refer to the component subexpression trees, and the parentheses are notational devices that are used to delimit expression trees. This action calls for the association of the recognized <Relation> with an expression tree. This results from joining expression trees which are associated with the left-subexpression and the right sub-expression with a root method that compares

"MacTCP" is version "2.02". Consider the state of the parser at the moment that it attempts to apply the <Relation> production with [RelOp]. The expression tree already associated with the left subexpression, \$1, has representation (Control-Panel "MacTCP") and that associated with the right subexpression, \$3, has representation (version (string "2.02")). The expression tree associated to the overall <Relation> expression is the merger of these two according to the pattern (is \$1 \$3). Hence, the resulting expression tree is representable as (is (Control-Panel "MacTCP") (version (string "2.02"))).

Associated with each production is an action of appropriate form which describes how the tree is built. In certain implementations, the tree may only be built up implicitly.

15

10

5

Parsing can continue normally, if at every step of the parsing the next available symbol matches an allowable type; or it can fail, if an unexpected combination occurs. As soon as parsing fails, the piece of advice may be declared not relevant.

20

In the currently understood best method of implementing the invention, each valid method is already known to the parser at parse time. Unlike some other languages, parsing can fail if a clause is syntactically correct but uses phrases that name currently unknown methods.

10

25

In the currently understood best method of implementing the invention, each subexpression takes values which are strongly typed and for which the type is known in advance. Example data types include integer, string, and Boolean. Each method is known at parse time to work with certain combinations of data types of inputs and to give certain definite data types as outputs. Attempts to apply methods to forbidden data types are diagnosed as failure of the parse. If so, the piece of advice may be declared not relevant.

At the successful completion of parsing, an expression tree is built up consisting in essence of a collection of method invocations and associated arguments and associated data types of those arguments. Evaluation of the expression is the process of performing the appropriate method dispatching in the appropriate order.

Evaluation can be successful, or it can fail. It can fail, for example, from excessive use of system resources, unavailability of a resource, excessive delay in obtaining a resource, or for some other reason. Successful evaluation can yield a Boolean value of True or False or some other value. The interpretation of a piece of advice as relevant is equivalent to saying that the evaluation is successful, the value was Boolean, and is true.

In particular, if a certain subexpression cannot be interpreted as a valid expression in the language, if the subexpression attempts to apply methods to forbidden data types, or if the subexpression cannot currently be evaluated, the whole expression can fail, and the advice is automatically declared not relevant.

.

Extensible Language

The purpose of the relevance language is to describe precisely the state of a computer, its contents, attachments, and environment. This state can change as the consumer purchases new software and/or hardware, or as new software/hardware objects are invented. This state can change as consumer computers are used to represent consumers in new problem areas, for example, in personal finance, management of communicating devices in the home, or other areas.

10

5

Consequently it is not possible to delimit in advance the components of state that may be of interest to which the invention provides access. It is desirable for the relevance language to give future authors the ability to extend the relevance language to express concepts about system state that have not yet been conceived.

15

In one implementation of the invention, the vocabulary of the relevance language may be extended by the authorities and by authors at individual advice sites.

20

In that implementation, the relevance language is extensible by developing dynamically loaded libraries which add new vocabulary and semantics to the language and/or modify existing vocabulary and methods. These are referred to herein as inspector libraries and may be downloaded from an advice site and installed on a given consumer computer, thereby changing the meaning

15

20

25

of the relevance language on that computer, and allowing new bodies of advice to be interpreted on that computer.

These dynamically loaded libraries contain declarations of the new data types which must be added to the language, of the new properties associated with the data types, of the data type resulting when a specific property is obtained for an object of a specific type, and of methods, *i.e.* executable code that implements access to the properties.

10 Non-Procedural Language

Unlike many languages used in connection with the operation and/or maintenance of computers, the relevance language does not need to be procedural. That is, it need not specify how to manipulate the contents of various fragments of memory. This is the opposite of being descriptive. It is not necessary to enable traditional procedural services, such as loops, assignments, and conditionals.

On the contrary, making these services available in an expansive fashion may pose various security and privacy threats, by making it easy for carelessly written or maliciously written advisories to consume excessive resources at evaluation time.

In the currently understood best method of implementing the invention, procedural services are not made available in the relevance language. As inspection of the above grammar description shows the language has:

- no named variables
- no assignment statements

- no function calls, or at least no explicit function calls with variable arguments
- no loops or conditional execution

10

These differences in appearance between the relevance language and other common languages are rooted in the following view:

- Because of concerns about unattended evaluation, the language should ideally have no side effects on the computer or environment.
 - To inspire consumer confidence, consumers must have be able to see for themselves that the language has no effects on the computer or environment.

20

- A descriptive language, unlike a procedural one, has the appearance of having no side effects.
- In short, the structure of the language and the visible limitations should communicate a message of security to the consumer.

The following discussion addresses two key differences of the relevance language from procedural languages:

Function Calls. The relevance language has method dispatches which correspond to function calls in some other languages, but they are of a more tightly constrained form.

First, there are the unary methods and the binary methods that occur in arithmetic and logical operations: +,-,*,/, and, or, =, and similar operations. These can be thought of as unary or binary function calls, but they are of a very restricted form, implementing well understood methods that typically pose little danger or resource burden.

Second, there are unnamed properties such as modification time.

15

20

25

10

Third, there are named properties such as application Photoshop".

The unnamed properties can be thought of as function calls applied to an object, but very bland ones, because no parameters are involved. Typically, a property is computed by extracting a certain value from a certain slot of a data structure. They typically pose little danger or resource burden. The named properties may be thought of as two-variable function calls. The first variable is the object and the second object is the string name-specifier. However, these also are not very general operations because the string name-specifier, in one implementation, may not itself be a computed result. It must instead be string constant. The types of calculations that can be specified in this way are

tightly constrained. Again, typically a named property is computed by extracting a certain value from a certain slot of a data structure, so it poses little danger or resource burden.

5 Loops and Conditional Execution.

The relevance language has no <u>for</u>, <u>while</u>, or <u>if</u> statements, but it does have a limited ability to perform iteration. It does this using a construct referred to as plural properties. In the relevance language there can be both singular and plural properties, *e.g.* both entry and entries properties, the first referring to a result which must be a singleton and the second referring to a result which may be a plurality. Typically, pluralities are further qualified by the use of the <u>whose</u> () clause to restrict to subcollections.

By the plural-singular dichotomy, certain fine distinctions of meaning may be maintained. For example:

exists application "Photoshop"

20 has the meaning that there exists exactly one such application; and

exists applications "Photoshop" whose(version of it is version "4.0")

has the meaning that there exists one or more than one application called 25 "Photoshop", and among those there exists one with version 4.0.

20

In the second example, an iteration is implicitly performed over the collection of all applications called Photoshop" on the system in question, so the effect of a loop is obtained without using traditional procedural programming.

The restrictions on the expressiveness of the language help make the language safer from the viewpoint of privacy and security guarantees (see below). Nevertheless, the language is designed to be powerful in that it is intended to be highly expressive. A few words in this language provide access to answers about the system state which would be impossible to obtain in traditional procedural languages short of writing hundreds of lines of code and invoking many specialized functions in system libraries.

If an apparent need should arise for the kind of services that traditionally are handled by procedural languages, it may typically be satisfied by extending the relevance language using the inspector library mechanism mentioned earlier, and described in more detail below. This has two advantages:

[Efficiency] Including new inspectors by this extension mechanism, rather than by offering procedural services in the relevance language, leads to more efficient execution. Inspectors typically make available efficient compiled methods of execution, minimizing burden on system resources at relevance evaluation time while the relevance language is interpreted, which is typically slower.

25 [Security] Including new inspectors by this extension mechanism allows one to correct problematic situations. If a certain complex expression is used in many places and has bad side effects, then it can be very hard to correct. If an equivalent piece of code is included as an inspector library, then one can identify the problematic code by using the relevance language to identify whether that inspector is installed on the user computer. This makes it possible to write counter advisories against advice that depends on inspector libraries.

Consumer-Accessibility

The relevance language controls the execution of a system on a potentially vast number of computers. It is highly desirable, though not strictly necessary, for a relevance clause to be something which, in principle, a consumer could read and form an approximate understanding of, though few users may choose to do this in most cases.

15

5

In the currently understood best method of implementing the invention, the syntax of the relevance language resembles the syntax of plain English, with key roles in the language played by clauses formed from articles such as <u>of</u>, <u>as</u>, <u>whose</u>, and verbs such as <u>exists</u>.

20

The highly constrained nature of the language fosters consumer understanding. The language avoids constructs which assume a computer programming background by suppressing concepts such as arrays, loops, and conditional evaluation.

Inspector libraries

Components of inspector libraries

5 Parsing of a clause in the relevance language results, conceptually, in the

generation of a list of method dispatches (see Fig. 11), in which certain

methods are called in a certain order with certain argument lists. This

evaluation is a process of systematically carrying out the sequence of method

dispatches in the appropriate order. Method dispatches are an important

10 aspect the relevance process.

An inspector library is a collection of methods (see Fig. 15) and associated

interfaces which allows for the installation of methods into the advice reader.

Because of the structure of the parser and the evaluation process, an

inspector library may contain some of the following components:

Declaration of a [Phrase] to be used in the relevance language.

Association of that [Phrase] to a specific method.

20

15

Declaration of a new data type to be used in the evaluation process.

Declaration of the calling prototype of the method. This includes the

number and the required data types of the arguments to be supplied to the

method.

- Declaration of the result data type of the method.
- Implementation of that method in executable form.
- Declaration of special hooks associating code to be called on events, such as advice reader initialization, advice reader termination, beginning of advice reader main evaluation loop, and ending of advice reader main evaluation loop.
- Declaration of special hooks associated with creation and maintenance of special caches associated with the method.
 - Implementation of special event methods and cache methods in executable form.

Conceptually, an inspector library can be linked into the advice reader with all the declarations evaluated, resulting in changes to the advice reader's internal data structures, so that new method invocations become available.

These declarations affect two fundamental data structures of the system. The first is a syntax table giving all allowed phrases and the associated data types on which they may operate and the associated data types that result. This is used at lexical analysis time. The second is a method dispatch table, giving a systematic way to determine the associated executable method for a given phrase and data types. This is used at evaluation time.

Object-Oriented Structure

A convenient way to implement the above inspector library structure is to rely on the features of a modern object-oriented programming language, such as C++. In effect, the built-in features of such a language, *i.e.* object declarations, polymorphism, and operator overloading, are ways of declaring that certain phrases have a certain meaning when applied to certain data types, and of systematically organizing that information. Other features, such as constructors, copy-constructors, and destructors, are ways of defining certain initialize time and terminate time code bodies.

In the currently understood best method, such features of modern object oriented languages are used to provide the various features of inspector libraries.

15

20

25

10

5

Extension

In one implementation, as described above, it is possible to install several inspector libraries in an instance of the advice reader. The inspector libraries that are so installed define the set of recognized [Phrase]s in the relevance language, the set of allowable data types at evaluation time, and the set of methods associated with those data types.

In short, the relevance language may be dynamically constituted. In one implementation, inspector libraries may be created by advice providers and downloaded to the consumer computer as part of the site synchronization.

Such libraries may be managed by the advice reader, for example, by storage in a well known location, such as a subdirectory of the overall directory managed by the advice reader. The inspector libraries in this directory may be linked into the advice reader at the time the advice reader is initialized.

5

When this linking happens, declaration routines are invoked, installing new [Phrase]s in the lexical analysis table of the relevance language, and associating these [Phrase]s to certain method invocations. The language expands in this way to include new descriptive possibilities.

Layered Language Definition

The relevance language may therefore be open ended, built up in layer upon layer of extensions. Hence, to understand a completely installed system is to understand the layers which have been installed, and to understand the methods that each layer provides. In a typical installation, these layers are as follows:

- Base Layer. Contains the basic mechanics of clause evaluation: a number
 of basic built-in phrases and associated methods. It is expected that the
 base layer is the same on every consumer computer carrying the advice
 reader.
- System-Specific Layer. This consists of a layer associated with a certain operating system, giving information about the characteristics of a certain family of computers and their attached devices and environment. For example, such a layer, in one implementation, provides methods to get the system date and time, the sizes of various files, the contents of the PRAM, or the names of attached peripheral devices.

20

25

15

5

10

Vendor-Specific Layers. This collection of potentially a large number of extensions layers is typically produced by third parties, giving special access to the internals of certain hardware devices and software products.
 One can think of potential authors ranging a span of products from hardware producers (e.g. of cable modems) to software producers (e.g. of Photoshop and plug-Ins) to service providers (e.g. America On-Line).

Example: Version inspector

The following is an example of an inspector for the version property of data type Application under the Macintosh OS. This inspector declares the following:

- A new [Phrase] to be added to the relevance language: version;
- A new data type, version, which has already been referred to in several examples above;
 - Several properties of this data type which are available under Macintosh
 OS:

15

Major Revision. The leading numeric field of the revision number.

Minor Revision. The secondary numeric field of the revision number.

Stage. A String, such as Alpha, Beta.

Country. A String, such as USA or France.

String1. A String.

25

String2. A String.

 Methods, in the form of executable code, which implement the above properties by opening the resource fork of the application, extracting the desired information, and converting into the required data types.

5

15

 A new named property of World, version, which casts a string property specifier, such as the 1.1 in version 1.1, into a version data type.

Upon installation, this inspector makes available to the system a series of data types and properties which may be as depicted in Fig. 14. As an example, to check if the beta version of an application with version number 0.99 is used, one might write the relevance clause:

Stage of application "Netscape Navigator" is "Beta"
and Minor Revision of application "Netscape Navigator" is 99
and Major Revision of application "Netscape Navigator" is 0

Special Inspectors

The language extension mechanism described above has powerful consequences, for example, as described in the following:

OS Inspectors

A system specific inspector can access the properties of the operating system and allow advice to be written to verify the existence and configuration of attached devices and other subsystems.

The following is an example of a valid fragment written for use with the Macintosh OS inspector library:

exists serial device "Modem Port"

The intent of this fragment is to check if this is the type of Macintosh having a dedicated modem port, which is to be distinguished from a Modem/Printer Port. The property of World referred to as serial device potentially matches several different devices. The qualifier selects from among those the one which has the name "Modem Port." If there are any such devices, the phrase evaluates to True. If not, the phrase evaluates to False.

input name of serial device "Modem Port" is ".Aln"

The intent of this fragment is to check if the modem port is using the standard serial driver for that port. The specific property of World referred to as serial device "Modem Port" is an object with property input name. The fragment checks to see if this is equal to .Aln, its usual value in the Mac OS.

Examples of other properties and data types available in the Macintosh OS inspector library include:

- Physical RAM. Property of World. Integer-valued: number of bytes of installed RAM memory.
- Logical RAM. Property of World. Integer-valued: number of bytes of
 installed RAM memory and virtual memory.
 - Virtual Memory. Property of World. Boolean-valued: True if the virtual memory option is enabled.
- PowerPC. Property of World. Boolean-valued: True if the CPU is a PowerPC.
 - System version. Property of World. Data type:version. Version of system which is currently installed.

 ROM version. Property of World. Data type: version. Version of ROM which is currently installed.

These examples make it clear that one can write relevance clauses which target machines having, for example, a small amount of memory, outdated ROMs, or old system versions.

Registry Inspector

Modern personal computer operating systems, such as Windows 95 and Macintosh OS 8, have special databases referred to as registries which

record a considerable amount of information about the configuration of the system, and the installation of certain pieces of software. A registry inspector is an inspector library which, when installed in the advice reader, enables the relevance language to refer to and evaluate properties of the registry database.

The following is an example on the Macintosh platform:

22 = integer value of entry "APPL.interrupt" of entry "bandit" of entry "Device Tree" of entry "devices" of Registry

The intent of the fragment is to enter the Macintosh name registry, find entry "devices", look for the entry "Device Tree" within that, and descend to the subentry "bandit" and then the subsubentry "APPL interrupt". The resulting entry is then converted into an integer value and compared with code 22.

The registry may contain a vast amount of information about the computer on which it operates. The registry inspector makes all this information accessible to the relevance language.

20

15

5

15

25

Preferences Inspector

Typical application programs on modern computers, such as Netscape and Microsoft Word, have special databases, referred to as preferences files, which record a considerable amount of information about the configuration of a certain program. A preferences inspector is an inspector library which, when installed in the advice reader, enables the relevance language to refer to and evaluate properties of the preferences file of a specific application.

10 The following is an example:

Suppose that the Web browser application Netscape Navigator has a preferences file, which associates to various content types. A helper application knows how to process that content type. For example, a helper application associated with a graphics file of type JPEG might be JPEGView, and a helper application associated with type x-pn-realaudio might be RealAudio Player.

Suppose that an advice provider called RealAudio wants to author advisories
which target users whose Web browsers are misconfigured, and to provide them with automatic corrections to the configuration.

Suppose that there is available a Netscape Navigator Preferences inspector and that, after installation of that inspector in the advice reader, Netscape Navigator Preferences becomes a property of World.

This provider could then target consumers with RealAudio products, but improperly configured Web browsers, by authoring an advisory with relevance clause:

15

```
exists application "RealAudio Player 4.0"

and exists application "Netscape Navigator"

and ( (helper name of entry "x-pn-realaudio" of entry "Helper Table"

of Netscape Navigator Preferences )

is not "RealAudio Player 4.0"

)
```

The intent of the fragment is to access the Netscape Navigator Preferences file, find entry "Helper Table", look for the entry "x-pn-realaudio" within that, and extract the associated helper name. The resulting entry is a string which is compared with "RealAudio Player 4.0."

The preferences file of a modern software application contains a considerable amount of information about the working of the application, and a preferences inspector makes all this information accessible to the relevance language.

Database Inspector

Many consumer computers contain, either explicitly or implicitly, a commercial database which stores information about the consumer. Examples include:

 Databases associated with personal finance programs. Consumers who use Check Free, Quicken, and similar programs implicitly have databases on their machine.

25

15

 Databases associated with small office suites. Consumers who are running small businesses have customer databases, supplier databases, and accounting databases on their machines.

A database inspector is an extension to the base relevance language whose purpose is to allow the relevance language to access fields in a database. An example syntax is as follows:

numeric field "CURRENT BALANCE" of FoxBase Database "Personal.DBF" < 0

The intent of this fragment is as follows: The advice provider is attempting to reach consumers who use CheckFree. Users of CheckFree have a FoxBase-created database resident on their machine which is identified as Personal.DBF. The fragment intends to reach such consumers whose current bank balance, as indicated by the database, is negative. The semantics of the evaluation depend on the implementation of the FoxBase Database inspector.

It may be assumed that this works as follows: A database named Personal.DBF is located on the consumer computer's mass storage, is interpreted as if in FoxBase format, and the numeric field with field name CURRENT BALANCE is extracted. The fragment then compares the extracted value to the value 0.

Note that if the consumer does not have a database of the indicated type, the clause above fails to parse or fails to evaluate. Either way, it is not declared

relevant. This reduces the need to worry about qualifying clauses of this type by lengthy preambles which check if the software of a certain type is available. Parse time failure could occur because the consumer computer does not have the FoxBase Database inspector installed. Evaluation time failure could occur because the file Personal.DBF cannot be located.

An application of this technology is in the technical support arena. Suppose that an advice provider publishes software which, as with CheckFree, creates and manages a database, and the provider would like to help consumers keep the database well updated. The advice provider could author advisories which target common problems in the consumer database, *e.g.* consumers who forgot to initialize the database with the correct balance. Such advisories would call these problems to the attention of consumers who have them, as well as specifying solutions to the problems.

15

5

10

User Profile Inspector

The invention maintains a file or files offering a user profile, consisting of certain identifying phrases and associated values.

20

25

A user profile inspector is an inspector library that can be installed in the advice reader and which enables the relevance language to refer to data stored in the user profile. At a high level of abstraction, this is the same type of function that is enabled by the database inspectors or registry inspectors, only with a different database being inspected.

10

15

As an example of how such an inspector might be used, suppose it was desired to reach users with Zip Codes of the form 947XX. Supposing that the user profile has a variable referred to as Zip Code, the relevance clause:

947 = (value of variable "Zip Code" of User Profile as integer)/100

would provide the needed functionality. The intent of this clause is as follows: The user profile is inspected, the variable named Zip Code is extracted, it is converted from string to integer, and the resulting integer is divided by 100. The two trailing digits are lost in the process, leaving an integer with three digits that may be compared to 947.

In one implementation, the user profile is a dynamically expanding database, with new variables added as advice providers need them. A mechanism is provided so that an advice provider can author a template file which describes a collection of variables to which the advice provider plans to refer in advisories and would like the consumer to specify. The template file is placed at the advice site and is automatically gathered at synchronization time. The template file is used to drive an editing module on the consumer computer which presents the user a list of the template variable names and a list of their current values or blanks if they have not previously been defined. The user can then fill in the blank fields and edit other fields. In this way, the variables which the provider wants defined can be brought to the attention of the user and edited.

25

The portion of the user profile associated with the specific advice site in this way is called the site profile. The advisory with relevance clause:

not exists Data file of site Profile

5

checks whether the site profile has been initialized for this site. If not, the advisory should have, as human-interpretable content, a message which indicates that the advice provider would like the user to fill out the user profile variables needed for correct functioning of advice associated with that site. It should have as computer interpretable content an invocation of an editing module which uses the new template to present the user with choices for editing a new user profile.

The advisory with relevance clause:

15

20

25

10

Modification Time of Data file of site Profile <

Modification Time of Template file of site Profile

checks whether the site profile has been updated since the last new template file. If not, the advisory should have, as human interpretable content, a message which indicates that the advice provider would like the user to add some new user profile variables needed for the future correct functioning of advice associated with that site. It should have as computer interpretable content an invocation of an editing module which uses the new template and the old profile to present the user with choices for editing.

Remote Inspector

In principle, inspector libraries can also give the relevance language the ability to inspect properties of other communicating devices. These include:

5

- Remote Physical Measurements. Ask other devices for information which those devices can measure, the information possibly to include position, temperature, voltage, or status of a process.
- Remote Device Queries. Ask other devices for information about themselves or about their state.
 - Remote Computation. Ask other computers for the result of a calculation, for example a calculation specified by a formula, program, or script provided by the inspector.
 - Remote Database Queries. Ask other computers with databases to answer queries concerning contents of those databases.
- Remote relevance Invocation. Pass a relevance clause to another computer and obtain the result, as evaluated by the other computer in that computer's environment.
- The following is an example of a remote physical measurement. Suppose there is an inspector library which defines a property of the World called Internet atomic clock and which has the ability to make queries to an

authoritative timekeeper by Internet protocols that can return the result as a relevance language time data type. Suppose that it also defines a property of the World referred to as system Greenwich Time which gives the Greenwich Mean Time equivalent of the system clock. The following relevance clause targets consumers whose system time is incorrectly set:

abs((Greenwich Time of Internet Atomic Clock) - System Greenwich Time) > time "10 Seconds"

The following is an example of a remote device query. Suppose there is an inspector library which defines a property of the World called network Postscript printer and which has the ability to make queries to the currently selected printer to determine if it is properly configured. A valid relevance clause is:

15

5

Model of Network Postscript Printer is "LaserJet 5" and ROM Version of Network Postscript Printer < version "2.0"

which targets those consumers with LaserJet 5 printers having old ROMs.

20

25

The following is an example of a remote database inspector. Suppose that the advice provider is a large organization that serves a population of advice consumers who are employees, who have small hand held computational devices, and who keep important data on a remote computer which has a trust relationship via security handshaking with these small devices. Suppose that the employees use organizational data which is accessible via a

Lightweight directory Access Protocol (LDAP) database server accessible over Internet (see W. Yeong, T. Howes, S. Kille, *LDAP (Lightweight Directory Access Protocol)*, Internet Standards Track RFC 1777(1995)). The advice provider would like to serve up advice which asserts conditions about the employees assigned project which is not available on the hand held machine, but instead is available by LDAP queries to the LDAP server. In addition, it asserts conditions about the employees status which are only available on the hand held machine.

The provider develops an inspector library which can access data on the LDAP server, and an inspector library which can access data on the hand held device. Suppose that the installation of these inspectors includes steps to configure the LDAP queries with appropriate passwords and appropriate usernames. A valid phrase in the relevance language is:

15

5

sponsor of assigned project of Employee LDAP record is "U.S. Government" and (per diem charges of current daily expense of Employee Handheld record > 35)

- The intent of this fragment is for a certain entry to be extracted from the LDAP database associated with this employee, and the sponsor name compared to "U.S. Government." If that condition holds, the current travel expense record is queried for a *per diem* claim.
- This approach provides a way of anonymously and proactively targeting employees listed in the organizational database as subject to a *per diem* rate

10

15

lower than the expenses they are generating. Thus, the invention provides a method of checking expense claims during travel, well before submission.

Important issues arise in the specification of the interfaces with remote systems. One aspect is that there must be a trust relationship between the consumer computer requesting the remote service and the other device or computer fulfilling the request to allow automatic evaluation of relevance. The communications must be encrypted in some cases. The degree of resource use must be monitored. Digital authentication must be available in some cases. These are all details that can be handled by well-known mechanisms.

The provision of a process whereby an advice provider can author advisories which refer not only to properties of the consumer computer and its environment, but also to properties accessible by query from the consumer computer, creates a new communications protocol described below, *i.e.* the personal information access protocol.

Inspecting program log Files

20 Many computer software applications and processes maintain a log file or files the contain a record of the history of execution of the application or process. Standard examples of this include transaction logs kept by mail servers and by login daemons, backup logs kept by backup software, and error logs kept by user programs.

A program log inspector is an inspector library that can be installed in the advice reader and which enables the relevance language to refer to data stored in a certain log file or files. At a high level of abstraction, this is the same type of function that is enabled by database inspectors, registry inspectors, or user profile inspectors, only with a different database being inspected.

Such an inspector library defines access methods the allow one to obtain key data items from log files.

10

5

As an example of how such an inspector is used, suppose it was desired to reach users who run the application GraphMaker, where the log file generated by Graphmaker contained an error entry with error code 93456.

Suppose that this error code indicates that a certain PostScript printer was unable to process the file output by Graphmaker. It is desirable to communicate to consumers in this situation the fact that there is a workaround for this problem. Suppose that Graphmaker has an inspector library available at its advice site which implements a set of methods associated with the central data type, which is referred to as GraphMaker error log. Assume that when this inspector library is installed in the advice reader, GraphMaker error log is a property of World. Assume that GraphMaker error log has a property referred to as entry, and that the result of such a property is an object of type GraphMaker error log entry with properties error code and error message, yielding integer and string data types, respectively. Then, there:

15

exists entries "Error" of GraphMaker error log whose (Error Code of it = 93456)

provides the needed functionality. The intent of this clause is as follows: The file associated with the GraphMaker error log is located and opened, and a search is made through this file for entries of type error as opposed to warning. These entries are examined to determine if any of them is associated with an error code of the indicated type.

- This enables a technical support organization to develop a process for maintenance of complex products in the field where:
 - The product is developed so that exceptional conditions are identified and logged;

• Inspectors for this log are developed and published at an advice site; and

 Advice is authored which inspects the log to identify and correct problematic situations.

In this way a technical support organization can target consumers experiencing certain program faults.

Inspecting the Advice System

25

The advice reader maintains subscription information, pools of advisories and, in one implementation, logs that indicate the history of relevance evaluation and of automatic solution operation.

An advice system inspector is an inspector library that can be installed in the advice reader and which enables the relevance language to refer to data stored and managed by the advice reader itself. At a high level of abstraction, this is the same type of function that is enabled by database inspectors, registry inspectors, or user profile inspectors, only with a different database being inspected.

Such an inspector library defines access methods the allow one to obtain key data items from important components of the system:

• The subscription database: Existence or nonexistence of certain subscriptions, address of advice sites associated with certain subscriptions, synchronization schedule associated with certain subscriptions, digital authentication information associated with certain subscriptions, other interesting attributes.

20

2.5

The advice database: Existence or nonexistence of certain advisory in the
advice database. Relevance or irrelevance of certain advisory in the
advice database. Existence or nonexistence of certain author in the advice
database. Existence or nonexistence of certain subject in the advice
database.

• The advice readers log files: Existence of a subscription to a certain site sometime in the past. Existence or nonexistence of certain diagnostic conditions, for example, aborted evaluation of certain advisory due to excessive time to evaluate an advisory. Relevance of certain advisory at some time in the past. Acceptance by user of an automatic solution operator associated with certain advisory at some time in the past.

The advice readers configuration: Installation of certain inspectors.
 Parameters of advice reader operation. User Preferences.

10

15

5

As an example of how such an inspector is used, suppose that in January 1998 a special piece of patch code was released which modified the application Graphmaker. Suppose that most consumers who installed this patch learned of it through the advisory process described herein. It is desired to reach users running the application GraphMaker which at some point in the past, prompted by an advisory, had installed the patch to the Graphmaker application. Suppose this is because an improved version of the patch has become available.

A comprehensive strategy for this situation formulates several advisories. The strategy formulates an advisory for users who have a current subscription to the advice site. This is prosaic in construction, and uses mechanisms described earlier. However, a comprehensive strategy also formulates three other advisories intended ultimately for other users:

10

15

20

25

First, the strategy formulates an advisory for users who no longer subscribe to the advice site, but who may have done so at some time in the past. The advisory is distributed by various means outside the normal subscription mechanism of the invention, for example through a service, *e.g.* UrgentAdviceNet. This advisory looks to see if GraphMaker is installed, to see if there is no active subscription to the GraphMaker advice site, and then at the log file generated by the advice reader to see if Graphmaker advisory "98/1/08-1" was relevant at some time in the past and if the user had accepted the proposed solution. Any consumer for whom this is relevant is notified, first that they should resubscribe to the site if possible, and second that when they do they get instructions about updating the patched code.

Second, the strategy formulates an advisory for users who have never subscribed to the advice site and never received the earlier advisory. This advisory checks if the affected version of GraphMaker is installed, and then sees if the current subscription database shows no active subscription, and also if the log shows no formerly active subscription. Any consumer for whom this is relevant is notified, first that they should subscribe to the site if possible, and second that when they do they get instructions about updating the patched code.

Third, the strategy formulates a counter- advisory for users who have somehow obtained a copy of the former advisory by means other than subscription, and which is somehow still active in the advice database. Such an advisory is not automatically deleted by site synchronization because it is not associated with the originating advice site. The advisory identifies the

existence in the advice database of the old advisory. Any consumer for whom this is relevant is notified, first that this active advisory is no longer avowed by its author, second that the consumer should subscribe to the site if possible, and third that when they do they get instructions about updating the patched code.

Suppose that advice reader has an inspector library installed which implements a set of methods associated with three central data types, referred to as adviceNet subscription inspector, adviceNet advice inspector, and adviceNet history inspector.

With such inspectors one may target consumers who may have adopted the proposed solution of the advisory in the past, but who do not currently subscribe:

15

10

5

exists application "GraphMaker" whose(version of it is version "1.01")
and not exists entry "GraphMaker" of adviceNet Subscription inspector
and exists entry "relevant" of adviceNet History inspector
whose (author of it is "GraphMaker" and

20

identifier of it is "98/01/08-1" and adoption status of it is "Accept")

With such inspectors one may also target consumers who have never subscribed:

25

exists application "GraphMaker" whose(version of it is version "1.01")

and not exists entry "Subscription" of adviceNet History inspector whose (name of it is "GraphMaker")

With such inspectors one may also target consumers who received the advice

5 by other means than subscription:

exists application "GraphMaker" whose(version of it is version "1.01")
and exists entry "Advisory" of adviceNet advice Database
whose (author of it is "GraphMaker" and identifier of it is "98/01/08-1")

These inspectors enable a technical support organization to develop a process for maintenance of bodies of advisories and to adapt to the consequences of adoption/non-adoption of previous advisories.

A second type of example is provided by the case where an advice provider RealAudio wants to author an advisory checking whether a certain inspector is installed and is the correct version, for example, because advice depends on this. Assume that there is an inspector library which, when installed, adds adviceNet configuration as a property of World. RealAudio could serve up advice at its site with the relevance clause:

15

20

10

not exists inspector library "Netscape Preferences" of adviceNet Configuration

allowing one to check that an inspector library was not installed. The humanly interpretable content of the associated message is an explanation that for RealAudio advice to work properly, the user should get the appropriate inspector from the Netscape site. In addition, it could serve up advice qualified by:

version of inspector library "Netscape Preferences" of adviceNet

25 Configuration

is not version "1.0"

to target users with the wrong version of an inspector library.

Such an inspector enables a technical support organization to make sure that
the advice reader is correctly configured to use the advice provided by that
organization.

Variations

10 Alternate Transport Mechanisms

So far, the discussion herein has centered around a single mechanism for the transport of advisories. In fact, there are many situations where other means of transport are useful and/or desirable. Some such means of transport include:

 advice by physical transport. An advisory may arrive at the consumer computer by file copy from a floppy disk, CD-ROM, or similar physically transportable medium.

20

- advice by e-mail. An advisory may arrive as part of an e-mail message,
 routed from another consumer, or from an advice provider.
- advice by USENet. An advisory may arrive as part of a news message
 distributed according to the USENet protocol, posted by another consumer, or by an advice provider.

25

- advice by proprietary protocol. An advisory may arrive as part of a message distributed according to a proprietary protocol.
- advice by file transfer. An advisory may be obtained by file transfer from another machine, where said transfer uses an application other than the advice reader. For example, a user might direct a Web browser to download an advisory file that is pointed to by a hypertext link. Or, an application might direct the downloading of an advisory, without user control, using FTP or some file sharing protocol.

There are three different procedures for treating advice that has arrived by one of these routes:

- Adding to advice database. The advice is added to the existing database of advice being tested continually for relevance.
 - Situational evaluation. The advice is evaluated for relevance when opened, but not entered into any permanently maintained pool. When closed, the advisory has no interaction with the system. This type of advice is part of a manual check, for example, in a once only situation.
 - Stockpiling. The advice is stored on the consumer computer's storage device for future use. This means that at some future time it is added to the advice database or at some future time it undergoes one-time evaluation.

The possibility of situational evaluation, *i.e.* situational advice, bears special notice (see Fig. 16). This can be used to create rather complex digests of advisories which are opened by the consumer only when special needs or situations arise.

The following are examples of alternate transport mechanisms applied in the technical support application area:

- advice before purchase. An advice digest arrives at the consumer computer as part of the shopping process for a new piece of software or hardware on the consumer computer. This collection may arrive by physical transport of media or by electronic transfer, for example, the consumer may obtain the digest from a Web site devoted to shopping.
 The digest, when processed by the advice reader, evaluates the consumers hardware situation and informs the consumer about its suitability for various possible purchases. The process is typically run only once.
- advice with installation. An advice digest 160 may arrive at the consumer computer as part of the installation process for a new piece of software or hardware on the consumer computer. This piece of software may have arrived by physical transport of media 161 or by electronic transfer 162. The new advisories may be added as part of an automatic initialization process whereby a subscription is automatically initiated and the advisories are placed in the advice pool as a way of initiating the local site

image. An optional synchronization of the user location with the advice site may occur 163. The user reader opens the advice digest 164 and evaluates advice relevance 165. Advisories are displayed with optional solutions 166 and the user reacts to the advisories 167. The system may perform a standard software installation 168 and enter a subscription to a post-install advice site 169 to receive post-install advisories 170.

problem diagnosis. An advice digest may arrive at the consumer computer as part of the installation process for a new piece of software or hardware on the consumer computer. However, no use is made of the digest at installation time. Instead, the digest is copied onto the storage device of the computer. Later, the user is informed to open the digest by any of several means for situational use when a certain problem arises. Upon doing so, the user is notified of various advisories which apply to this specific situation and hardware/software/settings configuration. After the episode is over, the advice is closed, perhaps to be reopened at some later time for possible reuse.

Alternate Notification Mechanisms

20

25

15

5

10

Advisories can be presented to the user in other ways than through the usual advice reader interface. For example:

 Via Notify Box in Other Applications. The user may be notified of the existence of a relevant advisory while using another application.
 Notification uses a mechanism appropriate to that application. For

25

example, the consumer is engaged in another activity, e.g. viewing a video, and is notified in an unobtrusive way, e.g. in this case by picture-in-picture.

- Via Desktop/Screen Saver. The user may be notified of the existence of a relevant advisory when he is not using an application. Notification uses a mechanism appropriate to the default presentation. For example, the desktop has an animated icon depicting the existence of relevant advisories. Another example, a screensaver presents an animated presentation whose state indicates status of machine, e.g. subsystems affected by advisories.
- Via e-mail. The user may be notified of the existence of a relevant advisory by electronic messaging using e-mail. This includes textual summaries indicating the number and type of relevant advisories and the number and type of affected system components.
 - Via messaging. The user may be notified of the existence of a relevant advisory by electronic messaging driving other modalities of information transmission. This may include standard means of communication, such as pager, phone, and fax transmission. For example, in an environment where consumer appliances are connected to a computer in the home, the invention inspects properties of the devices and pages the consumer with urgent messages. An advisory is written referencing the temperature in the home, with the effect that if the temperature were excessively high or low, an advisory is relevant. Assuming that the relevance notification is set

up to use alphanumeric paging, the consumer is paged to indicate that the temperature in the house was out of normal bounds.

Frequency of Relevance Evaluation

5

20

As so far described, relevance evaluation is a process carried out by the advice reader. A typical implementation continually evaluates all advice in the advice database for relevance, metering total CPU resource usage, and keeping resource consumption measured over intervals of, e.g. 1 second,

10 below a certain fraction of available CPU time.

A typical implementation allows user involvement in three ways:

First, by allowing the user to set parameters controlling the fraction of CPU 15 resource used during continuous evaluation.

Second, by allowing the user to group advisories into special pools which are evaluated according to a differing schedules. For example, a manual pool is evaluated only under manual evaluation, while a nightly pool is evaluated only at a certain user specified time in the evening.

Third, by allowing the user to schedule relevance evaluation for an individual piece of advice manually, overriding all pool membership parameters.

25 There are a variety of important variations on this approach:

10

- Skipping evaluation. In certain settings, it may be desirable not to evaluate each piece of advice in a pool with each pass through the pool. For example, those pieces of advice which take a very long time to evaluate are periodically skipped, or skipped based on the CPU usage of other applications running on the consumer computer. A piece of advice which is unevaluated retains the relevance status of the previous evaluation.
- Scheduling based on author comments. In one implementation, the author of the advisory can specify the scheduling of relevance evaluation. He includes in the advisory file an Evaluate-When line that specifies details of evaluation scheduling. Options may include either a periodic schedule for relevance evaluation, a condition for relevance evaluation, or membership in a well known advice pool with a standard evaluation schedule.
- Scheduling based on advice reader analysis. The process of evaluating relevance may be viewed as analogous to the process of running various processes in a computer operating system. Using traditional operating systems scheduling ideas, it is possible to allocate priorities to advisories and to assign lower priorities to certain processes. A special case of this is the procedure skipping evaluation, discussed above.

Variations in Relevance Evaluation

Simulated Conditions. In certain situations (see Fig. 17), it is useful to the consumer to simulate evaluation of advice in an environment other than the one which actually obtains.

10

In one implementation of the advice reader, a method is provided to simulate conditions which do not in fact obtain. Such an advice reader has a modification to the method invocation dispatcher of the advice reader. In this modification, the name of the method and the involved data types are compared with a simulation table 172 in a proxy layer 173 before a method dispatch occurs. The simulation table contents are user editable 171. If there is no match, dispatch occurs as normally, *i.e.* an advisory received from an expression tree evaluator 174 is dispatched by the method dispatcher 175. If there is a match, dispatch is suspended, and instead the value of the method is obtained by look-up from the associated cell of the simulation table. The result in either case is passed by the proxy layer to the system, *e.g.* to the file system inspector 176 or registry inspector 177.

Such an implementation allows the consumer to simulate conditions. The consumer overrides the usual relevance evaluation procedure by editing the simulation table, and by installing names of methods and argument types to be bypassed and the associated values to be returned.

- 20 In this way it is possible to provide a tool to:
 - Pretend the existence of devices which are typically connected, but are currently unreachable;

- Determine whether a certain advisory or family of advisories goes away
 (i.e. become irrelevant) if certain modifications to the consumer computer are made, without actually making the modification;
- Determine if the installation of a product causes certain advisories to become relevant.

There are many other applications of this approach.

 User filtering. It has been tacitly assumed that a user typically wants to see all relevant advisories from all sites. In practice, a user might be interested in filtering the display of advisories, focusing on items from a certain site, from a certain pool, focusing on advisories which exhibiting certain keyword labels in the Refers-to or Solution-Affects.

15

Promotion of Trust

The invention provides a powerful tool for connecting advice consumers with advice provided by advice authors.

20

In certain settings, the invention must be security and privacy aware. For an extensive discussion of security and privacy considerations, see below. A typical instance of such a setting is where invention is:

• connecting an advice provider and a provider consumer via a public network, such as the Internet;

• the typical advice consumer is a lay person; and

the advice provider is a large business or other concern which needs to

5 protect and enhance its reputation.

In such a setting, it is important to take into account the widely perceived

insecurity of public networks, and to offer tools so that consumers and

providers behave wisely.

10

15

The communications process disclosed herein is designed to support the

development of wise habits on the parts of both advice consumers and advice

providers. A cornerstone of the process is that users should only interact with

trusted providers, and to this end, the invention provides technology

supporting the evaluation of trustworthiness by consumers and maintenance

of trustworthy status by providers.

Importance of Trust

20 In general a trustworthy advice site has several qualitative attributes.

Quality. The advice is perceived by consumers as being well-intentioned,

well-conceived, and well-executed.

- Security. The advice is perceived by consumers as being secure, having no intent to harm, and having both an intent to help and being carefully tested and responsibly maintained.
- Privacy. The advice is perceived by consumers as being private, having no intent to snoop or pry, and having both an intent to keep private and being carefully designed and responsibly maintained to maintain that intent.
- Relevance. The advice is perceived by consumers as being tightly targeted, having no intent to go to wide populations of users as would a broadcast message (this is a practice sometimes called spamming in other messaging modalities, such as e-mail), and having both an intent to reach narrow groups of consumers with a focused need to know, and being carefully designed and responsibly maintained to achieve that intent.

20

The invention offers a number of technological tools facilitating open communication between consumer and provider which lead to proper attributions of trust. The invention, in one implementation, may offer mechanisms allowing interested providers to promote consumer trust and consumers to learn how to discriminate between trustworthy and untrustworthy providers:

effects of advice, to describe experiences during testing or in the field.

25

Disclosure. Advice providers may have the ability to disclose the potential

- Discovery. Advice consumers may have the ability to learn about the potential effects of advice, and about the experiences of others with certain advice providers, or with certain advice sites.
- Feedback. Advice consumers may have the ability to comment on their experiences with certain pieces of advice.
 - Correction. Advice providers may have the ability to retract faulty advice.
- Certification. Advice providers may have the ability to seek certification of their advice as safe and effective by an outside ratings service. The advice reader may have the ability to block advisories which are not rated in accordance with the consumer specifications.
- The following is a more detailed discussion of these mechanisms.

15

20

Disclosure Mechanisms

The invention offers advice providers the ability to describe, in the humanly Interpretable component of the message, the potential effects of advice, about the experiences of the advice provider in testing or from user feedback.

By using several methods of disclosure, an advice provider can gain consumer trust and visibility.

In one implementation, a more formal method of documenting and monitoring the effects of the advice is offered, enabling an advice provider to disclose names of potential effects through stereotyped keywords.

A central authority, such as Better Advice Bureau, publishes a registered list of keywords which are used to describe the subsystems of the user computer or its environment which may be affected by the proposed solution, or the effects of the proposed solution on personal privacy. An advice provider, in authoring advice, uses this mechanism to disclose potential effects of a recommended solution operator through stereotyped keywords in a header line Solution-Affects.

In one implementation of the advice reader, these keywords are searchable, and indexable and relevance evaluation is subsidiary to it.

Consumer ease of use may be bolstered, in one implementation, by allowing various kinds of user side filtering based on these keywords. For example, a

user plagued by enormous numbers of advisories whenever he detached the CD-ROM drive temporarily could use this feature to simplify his life. He would declare irrelevant all advisories referring to the CD-ROM drive in their keywords fields, and then afterwards detach the CD-ROM drive. In this way, even if there were advisories ordinarily triggered by the non-existence of an attached CD-ROM drive, the user would not have to see them. For an alternate mechanism, see the discussion of simulated conditions above.

Consumer confidence may also be bolstered by allowing such kinds of user-side filtering based on these keywords. For example, suppose that an available keyword reveals consumer Identity to a provider. By using this when it is the case, a provider has disclosed the effects of a message. A consumer who, as a matter of policy does not participate in surveys and similar information gathering advisories could specify that all advisories which contained this keyword should be declared irrelevant. In this way, the provider has done his duty to disclose and the consumer who trusts the provider is rewarded with the ability to see only the important messages.

Discovery Mechanisms

20

25

5

10

15

In a typical implementation, the advice consumer can inform himself of potential impacts of a piece of advice before deciding to apply the recommended solution operator. Some of this may already be done using existing Internet technology. The consumer can query other Web sites and search engines to see if there is any news about a certain advisory.

The invention extends this mechanism through a special Internet server, referred to as the Better Advice Bureau. The Better Advice Bureau serves as a central clearinghouse for information about the effects and side effects of advice. The user can at any time query the Better Advice Bureau, asking for any recorded comments about a specific advisory or a specific site.

Feedback Mechanisms

In a typical implementation, the advice consumer can provide feedback to the advice provider and to other consumers describing user experience with a piece of advice. Some of this may already be done using existing Internet technology. The consumer can use e-mail and USENet newsgroups to notify others about experience with a certain advisory.

In one implementation, the invention extends this mechanism through a special Internet server referred to as the Better Advice Bureau. The Better Advice Bureau serves as a central clearinghouse for information about the effects and side effects of advice. The user can at any time submit to the Better Advice Bureau Web site (described below), recording comments about the specific advisory or the specific site. The Better Advice Bureau can relay those comments to the advice provider, who can respond to them. In one implementation, the Better Advice Bureau protects the identity of the consumer by stripping off identifiers before mailing or posting. The Better Advice Bureau compiles all the information submitted by consumers, and provider responses, into a database available for queries over the network.

20

25

5

10

15

In one implementation, the advice reader offers a direct access to this feature by including an easy way to create a message automatically about a certain advisory in the standard advisory display, and address it to the authorities at Better Advice Bureau. For example, a button is placed as part of the advice browser window. By clicking on that button, a mailer window opens up with the sending and recipient addresses, and with the advisory number and

subject already supplied. The user is then always one click away from being able to record a commentary about certain advice.

10

15

20

Correction Mechanisms

In a typical implementation, the advice provider can disown advice that it has posted in error. This is done by removing the advisory from the provider's advice site. Over time, as subscribing advice readers synchronize with the provider's site, the advisory automatically disappears from those consumer computers.

In certain settings, this is not a sufficiently proactive solution. For example, certain advisories may be distributed by means other than the usual the advice reader/advice site model. To the extent that certain consumers may have such advisories in their advice pool, but without associating them with a subscription, they need to be dealt with by a counter advisory. This is an advisory which acts as advice against another piece of advice. Using an advice inspector library as described above, it is possible to write an advisory that is relevant when the consumer computer has a certain advisory in its main advice pool. Such an advisory is typically as follows:

The advisory 40139 which we released on 5/31/98 has been recalled, and we recommend that you delete it from your advice system immediately.

If you agree to this, click the <Dolt> button below. (signed) <Authors Name>.

20

25

Such counter advice is distributed by submitting it to UrgentAdviceNet, a special advice site to which all advice readers subscribe. The piece of advice is rapidly diffused to users.

- In summary, the invention offers the following process for dealing with faulty advice:
 - Removing the bad advisory from the providers advice site.
- Writing a counter advisory and submitting it to UrgentAdviceNet.
 - Writing a better advisory.
 - Placing the better advisory at the providers advice site.

Certification Mechanisms

One technique to further consumer acceptance of the use of advisories and the associated solutions is to remove some of the burden for determining the trustworthiness of messages from the individual consumer. A method to do this is for a ratings service at a central site to offer a service to advice providers that certifies advice as being in accord with certain publicly known privacy and security standards. Under existing Web protocols (see Khare, Rohit, *Digital Signature Label Architecture*, The World Wide Web Journal, Vol. 2, Number 3, pp. 49-64, Oreilly (Summer 1997) http://www.w3.org/DSIG) there is a method for the establishment of URL ratings services, via a

10

15

message block that can reliably certify that a certain ratings agency asserts that certain information resources have certain properties. The credibility of such assertions, *i.e.* that the advice is actually being certified by the service and not by an impostor, is based on deployment of standard authentication and encryption devices. Applying this technology, a ratings service can be established at a central site, *e.g.* Better Advice Bureau.org as described below, to certify that certain advice operates in a fashion generally accepted as appropriate for the advertised task, is used in a manner to protect individual identity, and has generally benign effects. Advice authors seeking certification of the trustworthiness of their advice submit those advisories to the certification authority, which studies the messages and, at its option, agree to certifies some of those messages. Here certification means that, according to a well known standard, a special ratings block is appended to the message indicating that the message is asserted by the authority to have certain attributes.

In one embodiment of the invention, the consumer is offered the option of making integral use of one or more ratings services. This functions as follows:

A ratings service uses a well known format, such as PICS (see Khare, Rohit, Digital Signature Label Architecture, The World Wide Web Journal, Vol. 2, Number 3, pp. 49-64, Oreilly (Summer 1997) http://www.w3.org/DSIG), for describing it ratings of resources such as advice sites and individual advisories.

15

20

25

The ratings service publishes a list of descriptive keywords used in the ratings system, such as BAB-Privacy-Standards-Compliant or does not affect file system.

The ratings service labels individual advisories using its own defined labeling system, inserting these labels into the advisories as ratings blocks according to a standard labeling format, such as PICS.

The ratings service labels individual advice sites by attaching labels to site description files using its own defined labeling system, inserting these labels into the site description files as ratings blocks according to a standard labeling format, such as PICS.

The ratings blocks are interpreted and authenticated by an established cryptographic signature mechanism associated with the service, and part of the ratings labeling standard.

• The user interface of the advice reader is extended to contain a new component, *i.e.* the certification manager. This component allows the user to permit advisories to be evaluated for relevance only when they have been credibly certified by a trusted privacy ratings service as having properties with which the user is comfortable. For example, the user blocks advisories which are not certified by Better Advice Bureau as BAB-Privacy-Standards-Compliant, thereby obtaining a measure of confidence that advisories used in his system do not violate his privacy by revealing information to the outside world.

10

15

The certification manager has two defined roles:

- Eliciting User Desires. The certification manager plays a role in initializing the certification process. It makes available to the user a list of potential ratings services among which the user can select. When a service is selected, the certification manager obtains from the ratings service URL a list of the defined ratings keywords, and allows the user to design a filter based on specifying that certain keywords or combinations of keywords must be present (or absent) for a message to be trusted.
 - Enforcing Policy. The certification manager also has the responsibility to
 parse and validate the ratings associated with individual messages, and
 block the evaluation of uncertified messages, or of certified messages not
 exhibiting the users desired attributes.

Privileged Sites

In one implementation, the advice reader is preconfigured with hardwired subscriptions to three privileged advice sites. These built-in subscriptions play a central role in ensuring the security of the invention; together they form an immune system.

advisories.com

5

10

15

20

advisories.com is a Web and FTP site operated by the producer of the advice reader software. This allows users from all over the world to obtain information and updates about the system, about the advice reader, and any updates to the software or the invention's communication protocols.

It is also a trusted site for the distribution of subscription information. Digitally authenticated site description files can be found here for many of the major advice sites on the Internet. These site description files are signed with a digital signature mechanism that is automatically intelligible to every copy of the advice reader. This serves an important security function. As described in the section on security below, it is very important that there be a well known and trusted location that is the source for accurate information about starting a new subscription. By getting site description files from advisories.com, a user has a degree of confidence that he is getting accurate subscription information and is not vulnerable to various security problems.

It is also a site for the distribution of authoring information, in particular, coordination of certain authoring conventions. Two specific conventions have already been mentioned:

- 5 Keyword Coordination. This concerns the way in which advisories are used by advice authors to disclose descriptions of potential effects of advice on the consumers computer or possessions or environment. A current listing of adopted keywords may be made available at advisories.com site.
- Coordination of User Profile Variables. This concerns a mechanism by which new variables may be added to the user profile by different advice providers.

 A current listing of adopted variables their formats and promulgators may be made available at advisories.com site.

15 BetterAdviceBureau.org

Better Advice Bureau.org is both a Web site and an advice site on the Internet. It is a site dedicated to the maintenance of the communications protocol as a civilized means of communication.

20

25

The Better Advice Bureau.org Web site describes the principles of system operation, describes why the system is useful, and why it protects individual security and privacy. It describes known risks and recommended procedures for interacting with the system. It serves as a clearing house for user complaints about the operation of advisories, and as a place that consumers

may come to for research about the experiences associated with an advisory that they are contemplating to apply.

The Better Advice Bureau.org advice site is an advice site to which all advice readers subscribe. It issues what is referred to as meta-advice or counteradvice, in the form of advisories against bad advisories, or against bad sites. By this device, consumers become aware of situations within the advice process which are dangerous from the standpoint of security or privacy, and they can then take corrective measures.

10

15

20

25

5

It is also a site for the distribution of ratings information, in particular, publication of certain rating conventions, as described above. There are commonly accepted methods for rating resources on the Web according to criteria provided by a ratings service (see Khare, Rohit, *Digital Signature Label Architecture*, The World Wide Web Journal, Vol. 2, Number 3, pp. 49-64, Oreilly (Summer 1997) http://www.w3.org/DSIG). The Better Advice Bureau, in one implementation, functions as a certifier of the privacy and security and usefulness of individual advisories. In this role, the Better Advice Bureau rates individual advisories by including in them a certain special ratings block, according to a well known ratings format, such as PICS. The Better Advice Bureau also publishes at its Web site the information needed to interpret such ratings blocks, including:

 A list of descriptive keywords used in the ratings system, such as BAB-Privacy-Standards-Compliant or Does Not Affect file System. Public key information associated with the certification process.

UrgentAdvice.net

UrgentAdviceNet serves to distribute advisories rapidly to all advisory consumers. It is used sparingly, to deal with urgent situations acutely affecting significant numbers of users. In one implementation, it has a high priority in synchronization, being synchronized every time any synchronization takes place.

10

15

25

Other Application Areas

In this document so far, the invention has been described in connection with the technical support application. The following is a partial list of other applications to which the invention may be put.

Consolidator.com

An Air Ticket consolidator purchases a block of 50 seats on a flight from New York to London for August 20. The consolidator wants to resell those seats to travelers. The consolidator maintains a relationship with a variety of travel agents.

The consolidator uses the invention to market its product more efficiently.

The consolidator functions as advice provider, and authors an advisory whose relevance line asserts the existence of a consumer in the travel agency

customer database who has reserved a ticket to go to from New York to London on that date, or near that date. The advice provider places the advisory at his advice site.

Advice consumers, in this case the various travel agencies working with the ticket consolidator, have their representative computers set to subscribe to the consolidators advice site. They also install a special inspector in their computer which searches the travel agency customer database for customers with certain travel plans. Advisories flow to their computers and are automatically inspected for relevance. Here relevance means a potential traveler who has plans to travel. The travel agent offers the traveler a ticket at the reduced price provided by the consolidator. The consolidator then makes a sale and the travel agent a commission. All participants win.

15 CheapFlights.com

A large airline frequently has last minute opportunities for travel at bargain rates. The airline wants to match the tickets to consumers with a continuing interest in last minute travel to certain cities. This airline can use the invention to market its product more efficiently. The airline functions as advice provider and authors advisories whose relevance line asserts the existence, in the user profile, of an expressed desire to travel to a certain city. The advice provider places the advisory at his advice site.

Advice consumers, in this case the potential travelers, have their representative computers set to subscribe to the airlines advice site. They add

expressions of special interest to their user profiles indicating cities they are willing to fly to on short notice. Advisories flow to their computers and are automatically inspected for relevance. Here, relevance means a potential opportunity for a flight on short notice.

5

10

15

Commodity.com

The system above described works in many other commercial areas, *e.g.* one could build as a result, such sites as CheapConcerts.com and CheapHotelSuites.com working on similar principles.

Extending this point, it is possible to run a new type of commodity market using the invention. In one model (see Fig. 18), there is a central site referred to as Commodity.com that functions as the market maker. This is attractive in a setting currently handled by classified ads, where there are many individual offerors seeking a central marketplace. The process is as follows:

 Offeror submits to Commodity.com an advisory offering object for sale 180.

- Commodity.com advice site staff edits and posts advisories 181, 182.
- Users subscribe to Commodity.com 184.
- Subscribers input information about interests to user profile 189, 190.

• Relevant advisories concern objects meeting their interests. The process proceeds are described above, where the advice reader gathers advisories from Comodity.com 183. Relevance evaluation is performed 185 in accordance with a user profile 190, as inspected by a user profile inspector 186. The user view the relevant commodities 187 and acts on the information contained therein 188.

BalanceTransfer.com

In the world of financial services, there are many companies that attempt to market specific services to customers directly. These include credit cards with specially low rates on cash advances, particularly credit balance transfers from competing financial instruments, and mortgage refinancing offers.

The attempt to reach consumers is expensive and often difficult. Certain consumers, who might otherwise be interested in the financial benefits of the service, do not allow telephone or mail contacts. Other consumers do not disclose sensitive information over the phone, which is typically required to participate.

20

5

The following is an example of a financial services offer through use of the invention. This embodiment of the invention is described as a centralized system, although it easily could be a decentralized system.

 Offeror submits advisory to BalanceTransfer.com offering balance transfer to those with sufficient balances and incomes.

- BalanceTransfer.com advice site staff edits advisories and posts.
- User subscribes to BalanceTransfer.com.

- User fills out information about credit card balance, existing interest rate on balance, and income for User Profile.
- Advice reader uses remote connection to verify balance, preserving
 privacy.
 - Relevant offers are those which benefit user. The advisory, if well written, uses the income data to test if the applicant is approved. Hence, relevant advisories have credit preapproved.

15

There are many variations on this kind of advice. Home refinancing operates in substantially the same way. The advisory is written mentioning variables associated with the principal, current interest and term of an existing loan. An advisory is relevant if it provides a set of better terms than an existing loan.

20

There is no reason why this service must be globally centralized. In a typical variation, individual mortgage brokers offer their own advice sites.

BadPills.com

The invention can be used for a variety of consumer product warnings recalls, and safety advisories. The following is one example.

BadPills.com is a site where information is available about drug products and their interactions. The following describes is how the site operates to notify pharmacies about potentially damaging drug interactions in their customer base.

• The FDA and other organizations, *e.g.* pharmaceutical manufacturers and consumer organizations, submit information about interactions and side effects of medications. Each advisory has the following form:

The relevance clause asserts the existence in the pharmacy database of customers with active prescriptions for drugs with a known potentially damaging interaction.

The human readable content tells about the interaction, tells the pharmacist that he has such an interaction in his client base, and urges the pharmacist to correct the situation.

20

25

15

5

- Advice site collects submissions, edits and posts.
- Pharmacy subscribes to the site. As part of subscription initiation, the
 pharmacy must install a standard pharmacy customer database inspector
 on its computer. This inspector can check to see if any patients in the
 database have a certain prescription.

15

25

- Pharmacy computer gathers advisories routinely.
- Relevance evaluation generates queries to pharmacy customer database
 inspector.
 - Database inspector processes pharmacy database.
 - Relevant messages are provided for dangerous drug combinations.

There are many variations on this embodiment of the invention. A similar service for physicians is made available through a physician patient database inspector for those physicians who keep track of patient subscriptions on their office computers. A similar service for patients is made available through an individual health record database inspector for those Individuals who enter their own subscriptions in the user profile. One way to simplify this is to have an information exchange program, allowing a user to remotely query the pharmacy database for information about himself.

20 Group Anonymous Messaging

Suppose there is a group G of individuals who wish to have an anonymous communication with a provider P. The individuals in G are widely distributed and do not know each other. There is a way to use invention to set up a site for two-way anonymous communication of this kind.

Such communications are made widely available and are used by many persons. For the anonymity of the participants, it is important that the system be used by many different persons from many different groups.

The site is an anonymous posting advice site where any e-mail sent to a certain address has its identity stripped and is posted at the advice site. Such an advice site operates completely automatically. This site may be referred to as SecretFriends.org.

This site may be used in conjunction with private-public key cryptosystems.

Secure off-line refers to a system where an agent of G arranges with P for a conversation. The agent delivers to P a public-key which is created for G for the purpose of conducting this discussion. This key is not actually public. It is a secret known only to G and to P. It is only referred to as a public key because it is the key which is commonly made public in standard applications of public-private key systems. The key is only delivered to P. Similarly, the agent returns a specially created public key from P to G.

G and P exchange messages by the following process:

20

- Subscribing to SecretFriends.org.
- Authoring messages which are relevant only to those holding the decryption key they have released.

 Using anonymous remailers or other means to post to SecretFriends.org the encrypted messages.

This approach provides anonymous communications as follows: A participant's advice reader synchronizes with SecretFriends.org. Potentially, a great number of advisories, actually encrypted messages, are obtained. The only messages that are displayed by the advice reader are those that are actually decryptable using the indicated key. The others are all jettisoned. The relevant advisory is then decrypted and read.

10

15

5

This approach provides anonymity under the AEUP protocol because, assuming many different people are using SecretFriends.com, there are a great number of messages being placed there, and only a tiny fraction end up being of interest to a given reader. Because of the structure of AEUP, no one watching the process at the advice site can tell which messages turned out to be relevant to which user.

10

15

Distribution of Sensitive Product Information

A variant on the group anonymous messaging embodiment, in a specific setting, is provided as an information service for consumers of products who do not want it known that they use the indicated product. For example, users of antipsychotic medication or those undergoing cancer treatment.

Users of the sensitive product are given a numerical code with the purchase of the product which serves as the (secret) public key. The users then subscribe to a certain advice site, arranged in advance, which is, for example, SecretFriends.org, or an industrywide consortium site, for example DrugInfo.org. The users indicate in their subscription the (secret) public key. The advice reader periodically synchronizes with the site, and brings in advisories, some of which may concern the product. The others do not concern the product. Only the advisories associated with the specific medication pass the digital signature test and become relevant.

Security Issues

When the invention disclosed herein is implemented as described above and deployed in the technical support application, it may be operating in a security and privacy critical setting. The implemented system is then typically interacting automatically with the Internet, and obtaining and using resources from remote computers without direct human oversight. These resources remain resident on the consumer computer, typically over an extended period of time, being evaluated periodically for relevance. When relevant advisories

are identified, the advice reader displays to the human consumer the explanatory content of the relevant advisory. This explanatory content may propose to the consumer actions which may have effects on the computer, on attached devices, or elsewhere. If the consumer gives approval, these actions typically are then carried out automatically.

In short, the advice reader introduces into the consumer computer documents that are processed automatically and that after processing may propose to the user potentially permanent modifications to the computer or its environment. The consensus opinion of networking professionals (see Anonymous (1997) Maximum Security, Sams.net Publishing, Indianapolis; Oaks, S. (1998), Java Security, Oreilly, Sebastopol, CA; and Baker, R.H. (1995) Network Security, McGraw-Hill, New York) is that unsupervised interaction with the Internet poses serious risks. In fact the invention, in its standard mode of operation, does not expose the advice consumer or advice provider to risks greater than the baseline risks involved in typical usage of e-mail, browsers, and related Internet tools. Those modes of Internet interaction are currently considered acceptable risks. The invention, in a typical mode of operation, offers lower risk.

20

5

10

15

Preliminary Comments

Two fundamental points are of interest.

• Trusted sites. The concept of trust is discussed above. Users should only subscribe to advice sites that are known to them to provide trustworthy
